2. In *ornith.*, a tail-feather; one of the long or large quill-feathers of a bird's tail: so called from its use in directing or steering the course of a bird in flight, like a rudder. The rectrices are comparable to the similar large flight-feathers of the wing, called *remiges*. In the *Saururus*, or Jurassic birds with long lizard-like bony tail, the rectrices are biserially or distichonally arranged in a row on each side of the caudal vertebra. In all modern birds they are set together in a fan-like manner upon the pygostyle. (See *Eurhaptidura*.) In a few birds they are rudimentary, as in grebes. The most frequent number by far is twelve, which prevails (with few anomalous exceptions) throughout the great order *Passeres*, and also in very many other birds of different orders. In many pycnian birds the number is ten; in a very few eight. In various water-birds the rectrices run up to higher numbers, twenty-four being probably the maximum. There is normally always an even number, these feathers being paired. In size, shape, and texture they are endlessly varied, giving rise to all the different shapes a bird's tail presents.

**rectum** (rek'tum), *n.*; pl. *recta* (-tā). [= F. *rectum* = Sp. *Pg. recto* = It. *retto*, < NL. *rectum*, abbr. of L. *rectum intestinum*, the straight intestine: *rectum*, neut. of *rectus*, straight: see *right*.] In *anat.* and *zool.*, a terminal section of the intestine, ending in the anus: so called from its comparatively straight course in man; the lower bowel: more fully called *intestinum rectum*.

In man the rectum is the continuation of the sigmoid flexure of the colon, beginning about opposite the promontory of the sacrum, a little to the left side, and running through the pelvis to the anus. It is supported by a proper duplication of peritoneum, the mesorectum, and other fasciae. Its structure includes well-developed longitudinal and circular muscular fibers, the latter being aggregated into a stout internal sphincter muscle near the lower end. In animals whose colon has no special sigmoid flexure there is no distinction of a rectum from the rest of the large intestine; and the term applies only to any given or taken terminal section of the bowel, of whatever character. In mammals above monotremes the rectum is entirely shut off from the urogenital organs, ending in a distinct anus; but in most animals it ends in a cloaca common to the digestive and urogenital systems. The rectum receives the refuse of digestion, and retains the feces until voided. See cuts under *intestine*, *peritoneum*, *Pulmonata*, *Pycnogonida*, *Appendicularia*, and *Blattida*.—*Columns of the rectum*. See *column*.

It is a fusiform, bipennate muscle, arising by two heads from the ilium, and inserted into the base of the patella. See cut under *muscle*.—**Rectus lateralis**, the lateral straight muscle of the head, arising from the transverse process of the axis, and inserted into the jugular process of the occipital.—**Rectus medialis oculi**. *R. Choate, Addresses, p. 339.*

2. The state of being a recusant.

The papists made no scruple of coming to our churches; *recusancy* was not then so much as a chrisom, not an embryo.

*Jer. Taylor, Works (ed. 1835), II. 98.*

There is also an inferior species of *recusancy* (refusing to make the declaration against popery enjoined by statute 30 Car. II. st. 2, when tendered by the proper magistrate).

*Bancroft, Hist. U. S., II. 411.*

2. Specifically, in *Eng. hist.*, one who refused to attend divine worship in Anglican churches, or to acknowledge the ecclesiastical supremacy of the crown. Heavy penalties were inflicted on such persons, but they pressed far more lightly on the simple recusant or nonconformist than on the Roman Catholic recusant, the chief object being to secure national unity and loyalty to the crown, in opposition to papal excommunications, which declared British subjects absolved from their allegiance (as in 1570), and to plots against the government. The name *recusant*, though legally applied to both Protestants and Roman Catholics, was in general given especially to the latter.

As well those restrained . . . as generally all the papists in this kingdom, not any of them did refuse to come to our church, and yield their formal obedience to the laws established. And thus they all continued, not any one refusing to come to our churches, during the first ten years of her Majesty's (Queen Elizabeth's) government. And in the beginning of the eleventh year of her reign, Cornwallis, Bedingfield, and Sillyards were the first *recusants*, they absolutely refusing to come to our churches. And until they in that sort began, the name of *recusant* was never heard of amongst us.

*Jer. Taylor, Rule of Conscience, IV. 1. 1.*

Specifically—(a) In law, the recovering or disencumbering of property by one who had a right to it subject to the encumbrance or defeasible conveyance, as where a debtor by paying his debt gets back a pledge or a mortgaged estate; also, the right of redeeming and reentering. (b) In com., payment to the holders by the issuer of notes, bills, or other evidences of debt. (c) In *theol.*, deliverance from sin and its consequences by the obedience and sacrifice of Christ the Redeemer. The word *redemption* presupposes that man is in a state of bondage to the powers of evil—either spiritual powers external to himself, or evil passions and propensities within himself, or both—and that he can be delivered from them only by the sacrifice and suffering of another. This suffering is regarded as the price or ransom paid to redeem the captive. Thus, redemption is substantially equivalent to salvation, but involves the idea of a new and additional right over man acquired by God; and the doctrine of redemption includes the doctrines of atonement, justification, regeneration, and sanctification.

The pressure on the delivery side of the valve is thus kept from varying (except between very narrow limits) from its predetermined pressure, although the pressure on the opposite side may be variable, and always higher than on the delivery side. Such valves are much used for maintaining lower pressures in steam-heating and -drying apparatus than is carried in the boiler. They are also used in automatic air-brakes for railways and in other pneumatic machines, and, in some forms, as gas-regulators for equalizing the pressure of gas delivered to gas-burners, etc. Also called *pressure-reducing valve*.

**reductio ad absurdum** (rē-dukt'shi-ō ad ab-sēr'dum), [*L. reductio*, a leading, reduction; *ad*, to; *absurdum*, neut. of *absurdus*, absurd: see *absurd*.] A reduction to an absurdity; the proof of a proposition by proving the falsity of its contradictory opposite: an indirect demonstration.

In geometry the *reductio ad absurdum* consists in drawing a figure whose parts are supposed to have certain relations, and then showing that this leads to a conclusion contrary to a known proposition, whence it follows that the parts of the figure cannot have those relations. Thus, in Euclid's "Elements" the proposition that if a triangle has two angles equal the sides opposite those angles will be equal is proved as follows. In the triangle ABC, let the angles ABC and ACB be equal. Then, suppose AB to be greater than AC. Lay off BD = AC and join DC. Then, comparing the two triangles ACB and DBC, we have in the former the sides AC and BC and their included angle ACB equal in the latter to the sides DB and CB and their included angle DBC. Hence, these two triangles would be equal, or the part would be equal to the whole. This proof is a *reductio ad absurdum*. This kind of reasoning is considered somewhat objectionable as not showing the principle from which the proposition flows; but it is a perfectly conclusive mode of proof, and, in fact, is in all cases readily converted into a direct proof. Thus, in the above example, we have only to compare the triangle ABC with itself, considering it as two triangles according as the angle B is named before C or vice versa. In the triangle ABC the angles B and C with the included side BC are respectively equal in the triangle ACB to the angles C and B with the included side CB; hence the other parts of the triangles are equal, and the side AC opposite the first angle B in the first triangle is equal to the side AB opposite the first angle C in the second triangle.

**reduction** (rē-dukt'shon), *n.* [*< OF. reduction*, *F. réduction* = *Pr. riduzione* = *Sp. reducción* = *Pg. redução* = *It. riduzione*, *< L. reductio(n)*], a leading or bringing back, a restoring, restoration, *< reduce*, lead or bring back: see *reduce*, *reduct*.] The act of reducing, or the state of being reduced. (a) The act of bringing back or restoring.

By. Burnett, Records, II. 11.

(b) Conversion into another state or form: as, the *reduction* of a body to powder; the *reduction* of things to order.

(c) Diminution: as, the *reduction* of the expenses of government; the *reduction* of the national debt; a *reduction* of 25 per cent. made to wholesale buyers.

Let him therefore first make the proper *reduction* in the account, and then see what it amounts to.

Waterland, Works, VI. 186.

(d) Conquest; subjugation: as, the *reduction* of a province under the power of a foreign nation; the *reduction* of a fortress. (e) A settlement or parish of South American Indians converted and trained by the Jesuits.

Governing and civilizing the natives of Brazil and Paraguay in the missions and *reductions*, or ministering, at the hourly risk of his life, to his coreligionists in England under Elizabeth and James I., the Jesuit appears alike devoted, indefatigable, cheerful, and worthy of hearty admiration and respect.

(f) The bringing of a problem to depend on a problem already solved. (g) The transformation of an algebraic expression into another of a simpler kind. (h) The lowering of the values of the numerator and denominator of a fraction, or of the antecedent and consequent of a ratio, by dividing both by the same quantity. (l) The act or process of making a copy of a figure, map, design, draft, etc., on a smaller scale, preserving the original proportions; also, the result of this process. (m) In *surgery*, the operation of restoring a dislocated or fractured bone to its former place. (n) Separation of a metal from substances combined with it: used especially with reference to lead, zinc, and copper, and also applied to the treatment of iron ore, as when steel is made from it by a direct process. (o) In *astron.*, the correction of observed quantities for instrumental errors, as well as for refraction, parallax, aberration, precession, and nutation, so as to bring out their cosmical significance. A similar process is applied to observations in other physical sciences. (p) In *Scots law*, an action for setting aside a deed, writing, etc.—

**Apagogical reduction**, in *logic*, a reduction in which the contradictory of the conclusion becomes one of the premises, and the contradictory of one of the premises the conclusion. Apagogical reduction is an application of the *reductio ad absurdum*, and is also called *reductio per impossibile*. Example:

All M is P.  
Some S is not P.  
Ergo, Some S is not M.

*Reductio per impossibile.*  
All M is P.  
All S is M.  
Ergo, All S is P.

Example:

All M is P.  
No S is P.  
Ergo, No S is M.

*Long Reduction.*  
No P is S.  
All M is P.  
Ergo, No M is S.

**Ostensive reduction**, that reduction which has for its premises the original premises or their conversions, and for its conclusion the original conclusion or its converse.

See *improvement*, 2.—**Reduction reductive**, an action in which a decree of reduction which has been erroneously or improperly obtained is sought to be reduced.—**Reduction to the ecliptic**, the difference between the anomaly of a planet reckoned from its node and the longitude reckoned from the same point.—**Short reduction**, in *logic*, a reduction which differs from the original syllogism only in having one of its premises converted. The following is an example:

No M is P.  
All S is P.  
Ergo, No S is M.

*Short Reduction.*  
No P is M.  
All S is P.  
Ergo, No S is M.

**redwater** (red'wā'tēr), *n.* A disease of cattle, also called *hemoglobinuria*, or *hemoglobinemia*, because the coloring matter (hemoglobin) of the red blood-corpuscles which have been broken up in the system appears in the urine, and imparts to it a pale-red or a dark-red, portwine color. The disease prevails in various countries in undrained, unimproved meadows and in woods, whence it is also called *wood-sick*. According to some, it is caused by the ingestion of food growing in such localities; others attribute it to rheumatic attacks, resulting from exposure. Redwater is also a prominent symptom of Texas cattle-fever, and occasionally accompanies anthrax in cattle. It is rarely observed among sheep and swine.

It occupies the Coast ranges, where exposed to ocean fogs, from the northern limit of the State to the southern borders of Monterey county, but is most abundant north of San Francisco. It is the only congener of the famous big or mammoth tree, which it almost rivals in size. It grows commonly from 200 to 300 feet high, with a straight cylindrical trunk, naked to the height of 70 or

100 feet: the diameter is from 8 to 12 feet. The bark is from 6 to 12 inches thick, of a bright cinnamon color; the wood is of a rich brownish red, light, straight-grained, easily worked and taking a fine finish, and very durable in contact with the soil. Its wood is widely used as building timber on the Pacific coast of the United States; in California it is used almost exclusively for shingles, fenceposts, railway-ties, telegraph-poles, wine-butts, etc.

**2.** The name is also applied to various other trees. Thus, the East Indian redwoods are *Soyimida febrifuga*, also called *East Indian mahogany*; *Pterocarpus santalinus*, the red sandalwood (see *sandalwood*); and *P. indicus* (including *P. dalbergioides*), the Andaman redwood, or padouk. The last is a lofty tree of India, Burma, the Andaman Islands, etc., with the heart-wood dark-red, close-grained, and moderately hard, used to make furniture, gun-carriages, carts, and for many other purposes. Other trees called *redwood* are *Cornus mas*, of Turkey; *Rhamnus Brythoraylon*, the Siberian buckthorn; *Melania Brythoraylon* of the *Sterculiaceæ*, an almost extinct tree of St. Helena; the Jamaican *Laplacea* (*Gordonia*) *Hemalaphylon* of the *Ternstroemiaceæ*; *Colubrina ferruginosa*, a rhamnaceous tree of the Bahamas; *Ochna arborea* of the Cape of Good Hope; *Ceanothus spinosus*, a shrub or small tree of southern California; and any tree of the genus *Brythoraylon*. *Redwood* is also a local name of the Scotch pine. *ried* = OHG. *riot*, *riot*, MHG. *riet*, G. *ried*, *riet*, a reed; root unknown.] 1. Any tall broad-leaved grass growing on the margins of streams or in other wet places; especially, any grass of one of the genera *Phragmites*, *Arundo*, or *Ammophila*. The common reed is *Phragmites communis*, a stately grass from 5 to 12 feet high, found in nearly all parts of the world. It serves by its creeping root-stocks to fix alluvial banks; its stems form perhaps the most durable thatch, and are otherwise useful; and it is planted for ornamental. See the generic names, and phrases below. Compare *reed-grass*.

2. Some one of other more or less similar plants. See phrases below.—3. A musical pipe of reed or cane, having a mouthpiece made by slitting the tube near a joint, and usually several finger-holes; a rustic or pastoral pipe; hence, figuratively, pastoral poetry. See cut under *pipe*<sup>1</sup>.

4. In music: (a) In musical instruments of the oboe and clarinet classes, and in all kinds of organs, a thin elastic plate or tongue of reed, wood, or metal, so fitted to an opening into a pipe as nearly to close it, and so arranged that, when a current of air is directed through the opening, the reed is drawn into or driven against it so as to close it, but immediately springs back by its own elasticity, only to be pressed forward again by the air, thus producing a tone, either directly by its own vibrations or indirectly by the sympathetic vibrations of the column of air in the pipe. When the reed is of metal, the pitch of the tone depends chiefly on its size; but when of reed or cane, it may be so combined with a tube that the pitch shall depend chiefly on the size of the air-column. A *free reed* is one that vibrates in the opening without touching its edges; a *beating* or *striking reed* is one that extends slightly beyond the opening. In orchestral instruments, the wood wind group includes several reed-instruments, which have either double reeds (two wooden reeds which strike against each other, as in the oboe, the bassoon, the English horn, etc.) or a single reed (a wooden reed striking against an opening in a wooden mouthpiece or beak, as in the clarinet, the basset-horn, etc.). A pipe-

organ usually contains one or more sets of reed-pipes, the tongues of which are nearly always striking reeds of brass. (See *reed-pipe*.) A reed-organ is properly a collection of several sets of reeds, the tongues of which are free reeds of brass. (See *reed-organ*.) In the brass wind group of instruments, with but few exceptions, the tone is produced by the player's lips acting as free membranous reeds within the cup of the mouthpiece. The mechanism of the human voice, also, is essentially a reed-instrument, the vocal cords being simply free membranous reeds which may be stretched within the tube of the larynx. The quality of the tone produced by a reed varies indefinitely, according to the material and character of the reed itself, the method in which it is set in vibration, and especially the arrangement of the tube or cavity with which it is connected. The accompanying fig. 1 shows the construction of an organ-reed: a is the reed-block, which in use is inserted in its proper slot in the reed-board; b, the metal tongue, which is set in sonorous vibration when air is forced through the opening c. Fig. 2 shows the mouthpiece of a clarinet, in which a is the reed, held to the body of the mouthpiece by the split-bands b, which are drawn tight by the screws c. Air entering between the reed and the margin of an opening which it covers causes it to produce a musical tone, the pitch of which is varied partly by the position of the mouthpiece in the mouth and partly by the action of the keys. Fig. 3 shows the mouthpiece of an oboe, and similar reeds are used for bassoons and bagpipes. The reed is made of two counterparts of the same shape bound together by the thread d. The lower and middle parts of the mouthpiece are circular in cross-section, but the upper part c, the reed proper, is flattened. Air forced through this opening causes the reed to emit a harsh tone, which is softened in quality by the tube of the instrument. (b) In reed-instruments of the oboe class, and in both pipe- and reed-organs, the entire mechanism immediately surrounding the reed proper, consisting of the tube or box the opening or eschallot of which the reed itself covers or fills, together with any other attachments, like the tuning-wire of reed-pipes. (See *reed-organ* and *reed-pipe*.) In the clarinet the analogous part is called the *beak* or *mouthpiece*. (c) Any reed-instrument as a whole, like an oboe or a clarinet: as, the *reeds* of an orchestra. (d) In *organ-building*, same as *reed-stop*.—5. It is made of parallel slips of metal or reed, called *dents*, which resemble the teeth of a comb. The dents are fixed at their ends into two parallel pieces of wood set a few inches apart.

The reed for weaving the same is measured in an equally complex manner, for the unit of length is 37 inches, and according to the number of hundreds of dents or splits it contains, so is the reed called. For instance, a "fourteen-hundred reed" means that 37 inches of a reed of that number, no matter what length, contains 1400 dents, or about 38 per inch.

**reed-mace** (rēd'mās), *n.* The cattail; any plant of the genus *Typha*, chiefly *T. latifolia* and *T. angustifolia*, the great and the lesser reed-mace, the two species known in England and North America. *T. latifolia* is the common plant. It is a tall, straight, erect aquatic with long flag-like leaves and long dense spikes of small flowers, brown when mature. The abundant down of the ripened spikes makes a poor material for stuffing pillows, etc.; the leaves were formerly much used by coopers to prevent the joints of caaks from leaking, and have been made into mats, chair-bottoms, etc. It is so named either directly from its reed-like character and the resemblance of its head to a mace (club), or (*Prior*, "Popular Names of British Plants") from its being placed in the hands of Christ as a mace or scepter in pictures and in statues. Less properly called *bulrush*. In the United States known almost exclusively as *cattail* or *cattail flag*.

**reed-moth** (rēd'mōth), *n.* A British moth, *Macrogaster arundinis*.

**reed-motion** (rēd'mō'shon), *n.* In *weaving*, the mechanism which, in power-looms, moves the batten, carrying the reed for beating up the weft between the threads of the warp. The term has also been inappropriately applied to a "stop-motion" whereby, when the shuttle is trapped in its passage through the warp, the movement of the batten is stopped, to prevent breaking warp-threads by the impact of the reed against the shuttle. See *stop-motion*.

**reed-organ** (rēd'ōr'gan), *n.* A musical instrument consisting essentially of one or more graduated sets of small free reeds of metal, which are sounded by streams of air set in motion by a bellows, and controlled from a keyboard like that of the pianoforte. The two principal varieties are the *harmonium*, which is common in Europe, and the so-called *American organ*, the chief essential difference between which is that the former is sounded by a compression-bellows driving the air outward through the reeds, and the latter by a suction-bellows drawing it inward through them. The tone of the harmonium is usually keener and more nasal than that of the American organ. The apparatus for compressing or exhausting the air, and for distributing the current among the various sets of reeds and among the channels belonging to the various digitals of the keyboard, is not essentially different from that of a pipe-organ, though on a much smaller scale. (See *organ*.) The bellows, however, is usually operated by means of alternating treadles. The keyboard is exactly similar to that of the pipe-organ or the pianoforte, and has a compass of about four or five octaves. The tone-producing apparatus consists of one or more sets of small brass *vibrators* or *reeds* (see illustration); the pitch of the tone depends on the size of their vibratile tongues, and its quality on their proportions and on the character of the resonating cavities with which they are connected. Each set of vibrators constitutes a *stop*, the use of which is controlled by a stop-knob. The possible variety of qualities is rather limited. The treadles operate feeders, which are connected with a general bellows, so that the current of air may be maintained at a constant

tension; but in the harmonium the waste-valve of the bellows may be closed by drawing a stop-knob called the *expression-stop*, so that the force of the tones may be directly varied by the rapidity of the treading. In the American organ the force of the tones is varied by a lever, operated by the player's knee, which opens or closes a shutter in the box inclosing the vibrators. The harmonium sometimes has a mechanism called the *percussion*, providing a little hammer to strike the tongue of each reed as its digital is depressed, thus setting it into vibration very prompt-

Reed-organ.

*a*, case; *b*, stop-rail and stops; *c*, music-rack; *d*, keyboard; *e*, one of the pedals or treadles; *f*, one of the pedal- or treadle-straps which operate the bellows; *g*, *h*, pedal-spring which lifts the pedal after the latter has been relieved from the pressure of the foot; *i*, bellows-spring which opens the bellows after compression; *j* and *k*, upper and lower boards of wind-chest, inclosing space into which air is delivered from the bellows; *l*, reed-board, which supports the reeds in slots formed therein (see cut under *reed<sup>1</sup>*); *m*, *n*, swells (see cut below); *o*, reed-valve; *p*, valve-spring which closes the valve after the latter is opened by push-pin shown in the cut below. There is one of these valves for each key, admitting wind to one or more reeds of a set or such sets of reeds as are allowed to act by the stops pulled out, and of a particular tone corresponding with the key; *q*, stop-arm; *r*, key-frame.

ly. A *tremulant* is often introduced, consisting of a revolving fan, by which the current of air is made to oscillate slightly. More than one manual keyboard and a pedal keyboard, with separate stops for each, as in the pipe-organ, occur in large instruments. Occasionally a set of pipes is also added. Various devices for sustaining tones

Stop-action of Reed-organ.

*b*, stop-rail; *b'*, stop-knob; *b''*, stop-shank; *n*, stop-arm; *n'*, rock-lever, connected at *n''* to the lever *r*, the latter being pivoted to a rail at *a*. A downward projecting arm engages the crank of another rock-lever *t*, connecting with and actuating the stop-valve *w*; *x*, *y*, *z*, swells; *l*, reed-valve opened by the push-pin *v*, and closed by the spring *m*.

In the bass after the fingers have left the digitals, or for emphasizing the treble, are sometimes introduced. Piano-fortes are made with a harmonium attached (sometimes called an *æolian attachment*). The reed-organ has become one of the commonest of musical instruments. Its popularity rests upon its capacity for concerted music, like the pianoforte and pipe-organ, combined with simplicity, portability, cheapness, and stability of intonation. Artistically regarded, its tone is apt to be either weak and negative or harsh and unsympathetic. A variety of recent invention, the *vocalion*, has a remarkably powerful and mellow tone.

**reed-palm** (rēd'pām), *n.* A ratan-palm; a palm of the genus *Calamus*.

**reed-pheasant** (rēd'fēz'ant), *n.* The bearded titmouse or reedling, *Panurus biarmicus*: so called in allusion to the long tail. Also called simply *pheasant*. [Norfolk, Eng.]

**reed-pipe** (rēd'pip), *n.* In *organ-building*, a pipe whose tone is produced by the vibration of a reed or tongue: opposed to *flue-pipe*. Such pipes consist of a *foot* or *mouthpiece* containing the reed, and a tubular *body* furnishing a column of air for sympathetic vibration. The term *reed* is applied to both the vibratile tongue and the mechanism immediately surrounding it.

In the latter sense, a reed consists of a metal tube connecting the foot and the body of the pipe; at its lower end is an oblong opening or eschallot, over or in which is fixed the brass tongue or reed proper. The effective length of the tongue is controlled by a movable spring or *tuning-wire*, the head of which projects outside the pipe-foot. The pitch of the tone depends primarily upon the vibrating length of the tongue, but is modified by the length of the air-column in the body of the pipe. A reed-pipe, therefore, is tuned both on the reed and on the top of the pipe. The quality of the tone depends somewhat on the form of the tongue, but chiefly on that of the body as a whole. The force of the tone depends on the pressure of the air-current, on the size of the inlet to the foot, and on the exact adjustment of the tongue to the eschallot. Most reed-pipes have striking reeds, but free reeds are occasionally used. A set of reed-pipes is called a *reed stop*.

**reed-pit** (rēd'pit), *n.* [*ME. reede pytte*; *< reed<sup>1</sup> + pit<sup>1</sup>*.] A fen. *Prompt. Parv.* (*Halliwel.*)

4. A kind of commercial sponge which grows on reefs. [A trade-name.]

British Consul Little of Havana says, according to the "Journal of the Society of Arts," that the classes (of sponges) included are sheep wool, velvet, hard-head, yellow, grass, and glova. Very little reef, if any, is found in Cuba. *Science*, XIV. 351.

**Coral reef**, an accumulation of calcareous material which has been secreted from the water of the tropical ocean, and especially of the Pacific to the south of the equator, by the reef-building corals. Such accumulations, which are often of great dimensions, offer curious peculiarities of form and distribution. They have been classified under the names of *fringing* and *barrier reefs* and *atolls*. *Fringing reefs* border the land; *barrier reefs* extend parallel with but at some distance from the shore; *atolls* are approximately circular or elliptical in form, and typical atolls inclose a lagoon, which usually communicates with the ocean by one or more passages through the reef. Barrier reefs may be hundreds of miles in length; that off the shore of Australia is 1,250 miles long, and from 10 to 90 broad. Atolls vary from 1 to 50 miles and over in diameter. The principal mass of a coral reef consists essentially of dead coral, together with more or less of the skeletons and shells of other marine organisms; this dead material is mingled with debris resulting from the action of breakers and currents on the coralline formation. The exterior of such a reef, where conditions are favorable to the development of the coral animals, especially on its seaward face, is covered with a layer or mantle of living and growing coral, and the rapidity and vigor of this growth depend on the supply of food brought by the oceanic currents. Where the conditions for this supply have not been favorable, there the reefs are not found; where the conditions have been such as to encourage growth, but have ceased to have this character, there the formation of the reef has slackened or been stopped altogether. Investigations have shown that the reef-building corals cannot flourish where the temperature of the surface-water sinks below 70°; in the typical coral regions the temperature is decidedly higher than that, and its range very small. Neither can the reef-builders work at a considerable depth, or above the level of low tide; their entire vertical range is not more than 15 or 20 fathoms at the utmost. These conditions of coral-reef formation, coupled with the fact that the carbonate of lime in the form in which it has been left by the death of the organisms by which it was secreted is decidedly soluble in sea-water, are sufficient to account for all the peculiarities in the distribution and mode of occurrence of these remarkable structures. It is because the currents sweeping toward the eastern shores of the continents are warm and constant that, while the western sides of Africa and South America exhibit only isolated patches of coral, the eastern borders are abundantly supplied with it. It is not now considered necessary to call in the assistance of a general subsidence of the Pacific Ocean bottom in order to account for the form of the atolls; for it is the opinion of most of the recent investigators that all the characteristic features of the coral formations—whether these occur as fringing or barrier reefs, or as atolls—can be produced in regions of subsidence or of elevation, as well as in those where no change of level is taking place.

In very large ships, where the yards are so large as to make it inconvenient to tie the reef-points around them, the sails are sometimes reefed to jackstays on the yards.

2. In *metal.*, to bring into a condition of purity as complete as the nature of the ore treated will allow. Used chiefly with reference to gold and silver, especially with reference to the separation (parting) of these two metals from each other and from the baser metals with which they are combined in what are known as bullion-bars or bricks of mixed metals, as they come from the mills located at or near the mines. Refining is, in general, the last stage or stages in the metallurgical treatment of an ore. As the term *refining* is commonly used with reference to the manufacture of iron, it means the partial decarburization and purification of pig in the open-hearth furnace, for the purpose of rendering it more suitable for use in the puddling-furnace in which the process of converting it into malleable iron is completed. This method of puddling is called *dry puddling*. The operation of converting pig-into wrought-iron in the open-hearth furnace, when begun and completed without puddling, is generally called *fining*, and in this process charcoal or coke is used. There are many modifications of the fining process, but the principle is the same in all. In puddling, raw coal is used, and the fuel does not come in contact with the metal; in fining, the ore and fuel (either charcoal or coke) are together upon the same hearth. The

various fining processes for converting pig-into wrought-iron, with charcoal as fuel, were of great importance before the invention of puddling, by which method much the larger part of the wrought-iron now used in the world is prepared, and this is done, for the most part, without previous partial decarburization of the pig in the refinery, by the process known as *wet puddling*, or *pig-bolling*. See *puddle* and *finery*<sup>2</sup>.

The act of reflecting, or the state of being reflected; specifically, in *physics*, the change of direction which a ray of light, radiant heat, or sound experiences when it strikes upon a surface and is thrown back into the same medium from which it approached. Reflection follows two laws, viz.—(1) the angle of reflection is equal to the angle of incidence; and (2) the reflected and incident rays are in the same plane with a normal to the surface. If DE represents the surface of a mirror and CB the incident ray, then HBC is the angle of incidence, and HBA, equal to it, is the angle of reflection. This applies alike to sound, to radiant energy (heat and light), and also to a perfectly elastic body bounding from a perfectly elastic rigid surface. The plane passing through the perpendicular to the reflecting surface at the point of incidence and the path of the reflected ray of light or heat is called the *plane of reflection*. (See *mirror*, *echo*.) For the total reflection of rays when the critical angle is passed, see *refraction*.

*J. R. Seeley, Nat. Religion, p. 57.*

7. A kind of self-consciousness resulting from an outward perception, whether directly or indirectly; the exercise of the internal sense; the perception of a modification of consciousness; the faculty of distinguishing between a datum of sense and a product of reason; the consideration of the limitations of knowledge, ignorance, and error, and of other unsatisfactory states as leading to knowledge of self; the discrimination between the subjective and objective aspects of feelings. The Latin word *reflectio* was first used as a term of psychology by Thomas Aquinas, who seems to intend no optical metaphor, but to conceive that consciousness is turned back upon itself by the reaction of the object of outward perception. According to Aquinas, pure thought in itself can know nothing of singulars, or particular things; but in perception there is a peculiar sense of reaction or reciprocity which he calls *reflection*, and this first makes us aware of the existence of actual singulars and also of thought as being an action; and this, according to him, is the first self-consciousness. Scotus accepted reflection, not as affording the first knowledge of singulars, but as a perception of what passes in the mind, and thus the original meaning of the term was modified. Walter Burleigh, who died in 1337, affords an illustration of this when he says that the thing without is apprehended before the passion which is in the soul, because the thing without is apprehended directly, and the passion of the soul only indirectly, by reflection. Ramus, in his dissertation on reflection, defines it as "the successive direction of the attention to several partial perceptions." A still further change of meaning had come about when Goclenius, in 1613, defined reflection as "the inward action of the soul, by which it recognizes both itself and its acts and ideas." The importance of the word in the English school of philosophy (Berkeley, Hume, etc.) may be said to be due entirely to its use by Locke, who explains it as follows:

The other fountain from which experience furnisheth the understanding with ideas is the perception of the operations of our own mind within us, as it is employed about the ideas it has got; which operations, when the soul comes to reflect on and consider, do furnish the understanding with another set of ideas, which could not be had from things without; and such are perception, thinking, doubting, believing, reasoning, knowing, willing, and all the different actings of our own minds; which we being conscious of, and observing in ourselves, do from these receive into our understandings as distinct ideas as we do from bodies affecting our senses. This source of ideas every man has wholly in himself; and though it be not sense, as having nothing to do with external objects, yet it is very like it, and might properly enough be called internal sense. But as I call the other sensation, so I call this *reflection*, the ideas it affords being such only as the mind gets by reflecting on its own operations within itself. By *reflection*, then, in the following part of this discourse, I would be understood to mean that notice which the mind takes of its own operations, and the manner of them; by reason whereof there come to be ideas of these operations in the understanding.

Locke, Human Understanding, II. i. 4.  
Reid endeavored to revive the Ramist use of the word, for which he is condemned by Hamilton. Kant, in his use of the term, returns to something like the Thomist view, for he makes it a mode of consciousness by which we are made aware whether knowledge is sensuous or not. Kant makes use of the term *reflection* to denote a mode of consciousness in which we distinguish between the relations of concepts and the corresponding relations of the objects of the concepts. Thus, two concepts may be different, and yet it may be conceived that their objects are identical; or two concepts may be identical, and yet it may be conceived that their objects (say, two drops of water) are different. Mr. Shadworth Hodgson, in his "Philoso-

phy of Reflection," 1878, uses the term to denote one of three fundamental modes of consciousness, namely that in which the objective and subjective aspects of what is present are discriminated without being separated as person and thing.

The faculty by which I place the comparison of representations in general by the side of the faculty to which they belong, and by which I determine whether they are compared with each other as belonging to the pure understanding or to sensuous intuition, I call transcendental reflection.

Kant, Critique of Pure Reason, tr. by Müller, p. 261.

The particular reflection that states of consciousness are things, or that the Subject is its Objects, constitutes . . . the reflective mode of consciousness. . . . Perception . . . is the rudimentary function in reflection as well as in primary consciousness; and reflective conception is a derivative from it. S. Hodgson, Philosophy of Reflection, l. 2, § 8.

3. That which reflects. Specifically—(a) A polished surface of metal or any other suitable material, used for the purpose of reflecting rays of light, heat, or sound in any required direction. Reflectors may be either plane or curvilinear; of the former the common mirror is a familiar example. Curvilinear reflectors admit of a great variety of forms, according to the purposes for which they are employed; they may be either convex or concave, spherical, elliptical, parabolic, or hyperbolic, etc. The parabolic form is perhaps the most generally serviceable, being used for many purposes of illumination as well as for various highly important philosophical instruments. Its property is to reflect, in parallel lines, all rays diverging from the focus of the parabola, and conversely. A series of parabolic mirrors, by which the rays from one or more lamps were reflected in a parallel beam, so as to render the light visible at a great distance, was the arrangement generally employed in lighthouses previous to the invention of the Fresnel lamp, or dioptric light. The annexed cut is a section of a ship's lantern fitted with an Argand lamp and parabolic reflector.

a a is the reflector, b the lamp, situated in the focus of the polished concave paraboloid, c the oil-chimney, d the outer frame of the lantern, and e the chimney for the escape of the products of combustion. (b) A reflecting telescope, the speculum of which is an example of the converse application of the parabolic reflector, the parallel rays proceeding from a distant body being in this case concentrated into the focus of the reflector. (*a*) A general name for the Protestant bodies on the continent of Europe which trace their origin to the Swiss reformation under Zwingli and Calvin, as distinguished from the Lutheran Church. In France the Reformed were known as Huguenots. In the Netherlands the Arminians afterward separated from the Calvinists (Gomarists). In Germany, after 1817, the greater part of the Reformed and Lutherans combined to form the United Evangelical Church. Specifically—(*b*) In the United States: (*1*) The Reformed (Dutch) Church in America, growing out of a union among the Dutch churches in America in 1770 and finally perfected in 1812. The territory of the denomination was at first limited to the States of New York and New Jersey and a small part of Pennsylvania, but was gradually extended to the West. The affairs of each congregation are managed by a consistory, consisting of elders and deacons chosen for two years. The elders, with the pastor, receive and dismiss members and exercise discipline; the deacons have charge of the alms. Both together are ex officio trustees of the church, hold its property, and call its minister. Ex-elders and ex-deacons constitute what is called the Great Consistory, which may be summoned to give advice in important matters. The minister and one elder from each congregation in a certain district constitute a classis, which supervises spiritual concerns in that district. Four ministers and four elders from each classis in a larger district make a Particular Synod, with similar powers. Representatives, clerical and lay, from each classis, proportioned in number to the size of the classis, constitute the General Synod, which has supervision of the whole, and is a court of last resort in judicial cases. The church is Calvinistic in its theological belief, and possesses a liturgy the greater part of which is optional except the offices for the sacraments, for ordination, and for church discipline. (*2*) The Reformed (German) Church in the United States. This church was constituted by colonies from Germany in New York, Maryland, Virginia, and North and South Carolina. The first synod was organized September 27th, 1747, under the care of the Reformed Classis of Amsterdam. The church holds to the parity of the ministry, maintains a presbyterial form of government, is moderately Calvinistic in its theology, and provides liturgical forms of service, which are, however, chiefly optional. (*3*) The True Reformed Dutch Church, the result of a secession from the Reformed Dutch Church in America in 1822. (*4*) The Reformed Episcopal Church, an Episcopal church organized in the United States in 1873, by eight clergymen and twenty laymen previously members of the Protestant Episcopal Church. It maintains the episcopacy as a desirable form of church polity, but not as of divine obligation, continues to use the Book of Common Prayer, but in a revised form, and rejects the doctrines of apostolic succession, the priesthood of the clergy, the sacrifice or oblation in the Lord's Supper, the real presence, and baptismal regeneration.—**Reformed officer**, in the British army, one who is continued on full pay or half-pay after his troops are broken up. *Farrow*, *ML. Gr. *ἀνάλυσις*), NL. *refraction*, < L. *refringere*, pp. *refractus*, break up, break open, break to pieces: see *refract*.] *1.* The act of refracting, or the state of being refracted: almost exclusively restricted to physics, and applied to a deflection or change of direction of rays, as of light, heat, or sound, which are obliquely incident upon and pass through a smooth surface bounding two media not homogeneous, as air and water, or of rays which traverse a

medium the density of which is not uniform, as the atmosphere. It is found (*1*) that, when passing into a denser isotropic medium, the ray is refracted toward the perpendicular to the surface, and bent away from it when passing into one less dense; (*2*) that the sines of the angles of incidence and refraction bear a constant ratio to each other for any two given media; and (*3*) that the incident ray and the refracted ray are in the same plane. Thus, if (fig. 1) SP represents a ray incident upon the surface of water at P, it will be bent away from its original direction SPL toward the perpendicular QP in passing into the denser medium, and make an angle QPR, such that the  $\frac{\sin SPQ}{\sin RPQ}$  is a constant quantity—that is, the perpendicular distance of a point *q* (such that the line from it to P, the point of incidence, is normal to the surface) from the refracted path bears a constant ratio to its distance from the path as it would be without refraction, however the angle of incidence varies; but this constant depends on the nature of the two media. If the first medium is air, this constant ratio is called the *index of refraction* or *refractive index* of the given substance (or *n*). Again, if the ray proceeded from R to P, it would be bent away from the perpendicular in the direction PS. The latter case is peculiar, however, in that for a certain angle of incidence called the critical angle (whose sine =  $1/n$ ) the angle of refraction of QPS is a right angle and a ray incident at P at any greater angle cannot pass out into the rarer medium

Fig. 1.

at all, but suffers total reflection at P. In fig. 2, AHC is the angle of incidence, and EHK the angle of refraction, CD being the normal to the surface; if, further, the second surface is parallel to the first, the ray emerging into the original medium at E has a direction EF parallel with its first direction, AH. If (fig. 3) the refracting medium has the form of a prism (ABC), the incident ray LF suffers a double change of direction, first (FE) in passing into the prism, and second (EG) in emerging from it; the total angle of deviation IDL varies in value with a change in the direction of LF, but has a definite minimum value when the angles of incidence and emergence are equal. If *d* represents the angle of the prism BAC, and *r* the angle of minimum deviation, IDL, then the refractive index *n* of the material of which the prism is made is given by the relation  $n = \frac{\sin \frac{1}{2}(d+r)}{\sin \frac{1}{2}d}$ . The angle of deviation or refraction also increases as the wave-length of the ray diminishes, and hence a beam of white light in passing through a prism is both refracted and dispersed, thus yielding a spectrum. The phenomena of the refraction of light explain the properties of lenses (see *lens*) and of prisms (see *prism and spectrum*). Sound-waves may also be refracted when passing from one medium to another of different density, obeying the same laws as light. *Double refraction* is the separation of a ray of light into two rays, which are unequally refracted upon passing through an anisotropic medium. This property belongs to all transparent crystalline substances except those of the isometric system. A striking example is calcite, hence called *doubly refracting spar*. In uniaxial crystals (those belonging to the tetragonal and hexagonal systems) one of the rays follows the ordinary law of refraction (see *law (2), above*), and is called the *ordinary ray*; the other, which does not, is called the *extraordinary ray*; both rays are polarized (see *polarization*), the ordinary ray having vibrations perpendicular to and the extraordinary ray vibrations parallel to the vertical axis. If the index of refraction is greater for the ordinary ray than for the extraordinary ray, the crystal is said to be *negative*, and in the opposite case *positive*: otherwise expressed, a crystal is *negative* or *positive* according as the crystallographic axis (optical axis) is the axis of greatest or of least elasticity. In the direction of the vertical axis a ray suffers no double refraction, and this direction is called the *optic axis*. In biaxial crystals (those belonging to the orthorhombic, monoclinic, and triclinic systems) neither ray follows the ordinary law of refraction, and there are two directions, called *optic axes*, lying in the plane of the axes of greatest and least elasticity, in which a ray suffers no double refraction. There are also three indices of refraction, corresponding to the rays propagated by vibrations parallel to the three axes of elasticity. A biaxial crystal is called *negative* or *positive* according as the acute bisectrix coincides with the axis of greatest or of least elasticity. According to the degree of difference between the two indices of refraction of a uniaxial crystal and between the greatest and least of the three indices of a biaxial crystal, the double refraction is said to be *strong* or *weak*; upon this difference depends the brilliancy of color of thin sections of a crystal as seen in polarized light. Amorphous substances like glass do not show double refraction, except under abnormal conditions, as when subjected to unequal strains, as in glass suddenly cooled. This is also true of crystals belonging to the isometric system, which, however, sometimes show secondary or abnormal double refraction (as garnet), due to internal molecular strain or other cause. For the refraction of the eye, see *eye*, and *crystalline humor* (under *crystalline*). Errors of refraction in the eye are tested by trial with lenses, test types, etc., by the ophthalmoscope, or by skiascopy or the shadow-test, and are corrected by appropriate glasses.

This arises from the air being denser near the surface of the earth than it is at higher elevations, its refractive power increasing as the density increases. The mirage is a phenomenon of terrestrial refraction.

**refrigerating-chamber** (rē-frij'e-rā-ting-chām'bēr), *n.* A chamber in which the air is artificially cooled, used especially for the storage of perishable provisions during warm weather.

**refrigerating-machine** (rē-frij'e-rā-ting-mā-shēn'), *n.* A machine for the artificial production of cold. In such machines mechanical power is employed for the conversion of heat into work by operating upon a gas at a temperature far removed from that at which such gas becomes a liquid. They perform the following cycle of operations: first, the gas is compressed into a smaller volume, in which compression its contained heat is increased by the heat-equivalent of the work performed in the compression; secondly, the compressed gas is cooled under constant pressure, and thus brought near to the temperature of the cooling medium (usually water), and the increase of heat due to compression is removed; thirdly, the compressed and cooled gas is permitted to expand, expending a portion of its expansive force in the performance of work. This work having been performed at the expense of the store of heat originally contained in the gas, the latter has now lost the heat-equivalent of the work, and its temperature is greatly lowered. The now cold gas can be used for the refrigeration of any other substance which has a higher temperature by methods described under *ice-machine* and *refrigeration*. In other machines a gas or vapor the ordinary temperature of which is near to that at which it liquefies is compressed and cooled, and subsequently permitted to assume the gaseous form. By the compression the temperature of liquefaction is raised till it becomes the same as or a little higher than that of a conveniently available cooling medium, such as ordinary atmospheric air, or, most commonly, water at ordinary temperature, the application of which to cooling the gas still under constant pressure reduces it to the liquid state, or to a state of intermixed liquid and gas. The subsequent expansion of the liquid into gas is performed at the expense of its inner heat. It therefore suffers a reduction of temperature, to restore which it absorbs its latent heat of vaporization from a surrounding or contiguous substance (usually a saline solution), which, thus made cold, is used for cooling air-spaces, or refrigerators or substances therein contained, or for making ice. Machines of either of the above classes are very commonly called *ice-machines*, and are so styled in the classifications of inventions in both the United States and British patent-offices, whether designed for the manufacture of ice, for merely cooling substances in insulated spaces or refrigerators, or for both these purposes.

**refrigeration** (rē-frij'e-rā'shon), *n.* [*< OF. refrigeration, F. réfrigération = Sp. refrigeración = Pg. refrigeración = It. refrigerazione, < L. refrigeratio(-n-), a cooling, coolness, mitigation (of diseases), < refrigerare, pp. refrigeratus, make cool again: see refrigerate.*] 1. The act of refrigerating or cooling; the abatement of heat; the state of being cooled.

The testimony of geological evidence . . . indicates a general *refrigeration* of climate.

*Croll, Climate and Time, p. 530.*

Specifically — 2. The operation of cooling various substances by artificial processes. This is effected by the use of inclosures in which the articles to be cooled are placed on or in proximity to ice or other refrigerating substances or freezing-mixtures, or in air cooled by a refrigerating-machine or apparatus; or, as in beer-cooling, by floating metallic pans or vessels containing ice upon the surface of the liquid to be cooled, or by circulating the latter over an extended surface of some good conductor of heat cooled by continuous contact of cold water, cold air, or cold brine with the opposite surface. See *ice-machine* and *refrigerating-machine*. — **Chemical refrigeration**, refrigeration by the use of mixtures of substances which, during their admixture, by mutual solution of each in the other, or the solution of one or more in another or others, become lowered in temperature by absorption of the latent heat of liquefaction from the sensible heat. Remarkable changes of temperature are thus produced by a variety of refrigerating mixtures or freezing-mixtures. See *freezing-mixture*. — **Mechanical refrigeration**. (a) In its strictest sense, the conversion of heat into work by the expansion of a volume of gas or vapor which performs work during the act of expansion, as in moving a piston against some resistance, usually that of a pump or compressor for compressing another volume of such gas or vapor. The gas during the expansion, if it expands adiabatically, is reduced in temperature by the conversion of its inner heat into work, the reduction being found in degrees by dividing the work due to the expansion by the product of the specific heat of the gas, the weight of the volume expanded, and the mechanical equivalent of heat. Air mechanically refrigerated is frequently discharged directly into refrigerators or rooms it is desired to cool, but in apparatus for cooling by the use of other gases and vapors a strong solution of some salt which resists freezing at low temperatures — as sodium, calcium, or magnesium chloride — is used as a medium for extracting heat from the substances and spaces to be cooled, and as a vehicle for conveying the heat so abstracted to the mechanically cooled gas. See *ice-machine*. (b) In a broader sense, a process of refrigeration in which the cycle of heat-changes is only partly produced by mechanical action, as in compression ice-machines using anhydrous ammonia, wherein the cooling of the vapor takes place entirely during the formation from the liquid, and is caused by absorption of the latent heat of vaporization from the sensible heat of the substance, the mechanical part of the process being wholly confined to compressing the ammonia-vapor while liquefying it under the action of cold and pressure. Such machines are the most effective and the most extensively used.

The act of regenerating or producing anew.—2. In *theol.*: (a) A radical change in the spirit of an individual, accomplished by the di-

rect action of the Spirit of God. Evangelical theologians agree that there is a necessity for such a radical spiritual change in man in order to the divine life; but they differ widely in their psychological explanations of the change. They are, however, generally agreed that it consists of or at least necessarily involves a change in the affections and desires of the soul. Regeneration is also understood, as by the Roman Catholic Church, to be the gift of the germ of a spiritual life conferred regularly by God's ordinance in baptism, which is accordingly called the *sacrament of regeneration*, or simply *regeneration*. The word *regeneration* occurs only once in the New Testament in its ordinary theological meaning; but equivalent expressions are found, such as "begotten again," "born again," "born of God," "born of water and of the Spirit."

According to his mercy he saved us, by the washing of *regeneration*, and renewing of the Holy Ghost. *Tit. iii.* 5.

3 (rē-jen'e-rā-shon). In *biol.*, the genesis or origination of new tissue to repair the waste of the body, or to replace worn-out tissue; also, the reproduction of lost or destroyed parts or organs. Regeneration of tissue constantly goes on in all animals in the ordinary repair of waste products of vital action; but the replacing of lost parts, as a limb, is nearly confined to animals below vertebrates, in many of which it is an easy or usual process.—**Baptismal regeneration**. See *baptismal*.—**Syn.** 2. See *conversion*.—3. See *reproduction*.

**regenerative** (rē-jen'e-rā-tiv), *a.* [= *OF. regeneratif*, *F. régénératif* = *Sp. Pg. regenerativo*; as *regenerate* + *-ive*.] 1. Producing regeneration; renewing.

*The American*, xiv. 23.

2. In *metal.*, a chamber filled with a checker-work of fire-bricks; that part of a regenerative furnace in which the waste heat of the gases escaping from the hearth is, by reversal of the draft at suitable intervals, alternately stored up and given out to the gas and air entering the furnace. The idea of employing what is now generally called the "regenerative system" of heating was first conceived by Robert Stirling, in 1816, but his arrangement for carrying it out was not a practical one. The present form of the furnace, and in general the successful application of the principle, constituting a highly important improvement in the consumption of fuel, are due to the brothers Siemens. The regenerative system has already been extensively applied in various metallurgical and manufacturing processes, and is likely to receive still further development. According to the Siemens regenerative method, there must be at least one pair of regenerative chambers, in order that the heat may be in process of being stored up in one while being utilized in the other. In the Siemens regenerative reheating- or mill-furnace there are two pairs of chambers, each pair consisting of one larger and one smaller chamber, through one of which the air passes, and through the other the gas on its way to the furnace. The so-called "Ponsard recuperator" is a form of regenerator in which, by an ingenious arrangement of solid and hollow fire-bricks, the current is made continuous in one direction, instead of requiring reversal as in the Siemens regenerative furnace. This form of furnace has been employed for reheating in rolling-mills.

**regenerator-furnace** (rē-jen'e-rā-tor-fēr'nās), *n.* Any form of furnace with which a regenerator is connected.

3. In the old universities, a master or doctor who takes part in the regular duties of instruction or government. At Cambridge all resident masters of arts of less than four years' standing, and all doctors of less than two, are regents. At Oxford the period of regency is shorter. At both universities those of a more advanced standing, who keep their names on the college books, are called *non-regents*. At Cambridge the regents compose the upper house and the non-regents the lower house of the senate, or governing body. At Oxford the regents compose the congregation, which confers degrees and does the ordinary business of the university. The regents and non-regents collectively compose the convocation, which is the governing body in the last resort.

Only *regents*—that is, masters actually engaged in teaching—had any right to be present or to vote in congregations [at Bologna]. *Encyc. Brit.*, xxiii. 835.

The regents have power to incorporate, and to alter or repeal the charters of colleges, academies, libraries, museums, or other educational institutions belonging to the University; to distribute to them all funds granted by the state for their use; to inspect their workings and require annual reports under oath of their presiding officers; to establish examinations as to attainments in learning, and confer on successful candidates suitable certificates, diplomas, and degrees, and to confer honorary degrees."—**House of regents**. It is the largest permanent association of soldiers, and the third subdivision of an army-corps, several regiments constituting a brigade, and several brigades a division. These combinations are, however, temporary, while in the regiment the same officers serve continuously, and in command of the same bodies of men. The strength of a regiment may vary greatly, as any regiment may comprise any number of battalions. The organization of the British Royal Artillery is anomalous, the whole body forming one regiment. It consists of about 33,000 officers and men, distributed in a number of brigades, each of which is as large as an ordinary regiment. 7. In *zoögeog.*, a large faunal area variously limited by different authors. Especially—(a) A realm; one of several primary divisions of the earth's surface, characterized by its fauna: as, the Palearctic or the Nearctic *region*. The term acquired specific application to certain large principal areas from its use in this sense by P. L. Sclater in 1857. Sclater's regions, adopted with little modification by Günther and Wallace, were six in number: the Palearctic, Ethiopian, Oriental or Indian, Australian, Nearctic, and Neotropical. (See these words.) Baird added a seventh, the West Indian, now considered a division of the Neotropical. In 1874 Sclater, following Huxley, recognized as primary divisions (1) *Arctogaea*, comprising the Palearctic, Ethiopian, Indian, and Nearctic regions; (2) *Dendrogaia*, represented by the Neotropical region; (3) *Antarctogaea*, with an Australasian region; and (4) *Ornithogaea*, with a New Zealand region. (b) A secondary faunal area, the primary being called a *realm*: as, the Antillean, Central American, and Brazilian *regions* of the American Tropical realm. In this sense it has been used by most American zoologists. Various other divisions have been proposed, as by A. Murray in 1886, Huxley in 1888, W. T. Blanford in 1890, E. Blyth in 1871, A. Newton in 1875, T. Gill in 1878, and J. A. Allen in 1878. Each of the main divisions, however defined by different naturalists, is subdivided into several subregions or provinces, more or less minutely in different systems. Thus, for example, the Ethiopian region is divided by Newton into the Libyan, Guinean, Caffrarian, Mozambican, and Madagascarian subregions, and the Libyan subregion itself into the Arabian, Egyptian, Abyssinian, and Gambian provinces. The waters of the globe have been either included in the prime divisions based on the land faunas, or segregated in peculiar ones.—*Abdominal regions*. The vocal registers are distinguished by quality more than by pitch, since the same tone can often be produced in more than one register. The difference lies in the way in which the larynx is used, but the exact nature of the process is disputed. The so-called *head-register* and *chest-register* include tones that call the cavities of the head and chest respectively into decided sympathetic vibration. The different vocal qualities are also called the *low, middle, and high registers*, or the *thick, middle, and thin registers*, depending in the first case upon the pitch of the tones for which they are best suited, and in the second upon the supposed condition of the vocal cords in producing them, or the quality of the tones produced.

2. Specifically, in the *law of conveyancing*, a system for the recording of conveyances, mortgages, and other instruments affecting the title to real property, in a public office, for the information of all concerned. The general policy of registry laws is to make a duly registered instrument notice to all the world, so that no one can claim any advantage over the registered owner by dealing with an unregistered owner or claimant in ignorance of the registered title. Under some systems a specified time is allowed for registering; and in some neglect to register an instrument within the time limited marks it with infirmity. The more generally accepted principle is to give effect to each instrument in the order of its registration, as against all unregistered instruments of which the purchaser, etc., had no actual notice. Another important element in registry laws is a provision that the record or certified copy shall be evidence in all courts equally as the original; but in some systems the non-production of the original must be accounted for before the record can be received in lieu of it.

[This use of the term originated in the fifteenth century.]

Which be the principles *irregulative*? The *Principles regulative* of a syllogism be these two phrases of speech: to be spoken of all, and to be spoken of none.

*Blundeville, Arte of Logicke* (ed. 1619), v. 1. (*b*) Since Kant, a rule showing what we ought to assume, without giving any assurance that the fact to be assumed is true; or a proposition which will lead to the truth if it be true, while if it be false the truth cannot be attained: such, for example, is the rule that we must not despair of answering any question by sufficient investigation. (*c*) A rule of conduct which, if it be pursued, may lead us to our desired end, while, if it be not pursued, that end cannot be attained in any way.—**Regulative use of a conception**. See *constitutive use of a conception*, under *constitutive*.

**regulator** (reg'ū-lā-tor), *n.* [= F. *régulateur* = Sp. Pg. *regulador* = It. *regolatore*, < ML. *regulator*, a regulator, ruler, < *regulare*, regulate: see *regulate*.] 1. One who or that which regulates. Members of the unauthorized associations which have at various times been formed in parts of the United States for the carrying out of a rough substitute for justice in the case of heinous or notorious crimes have been called *regulators*.

2. A mechanical contrivance intended to produce uniformity of motion, temperature, power, etc. (*a*) In *engin.* and *mach.*: (1) A governor in the sense described and illustrated under *governor*, *d.* (2) A governor employed to control the closing of the port-opening for admission of steam to the cylinder of an automatically variable cut-off steam-engine. This is a numerous class of regulators, in which the ball-governor described under *governor*, *d.* is used to control the motion of the induction-valve instead of that of the throttle-valve. By leaving the throttle-valve fully open and closing the induction-valve earlier or later in the stroke, the steam arrives in the cylinder nearly at full pressure, and with its full store of available heat for conversion into work by expansion. (3) An arrangement of weights, springs, and an eccentric or eccentrics, carried on the fly-wheel shaft or on the fly-wheel of a steam-engine, connected with the stem of the induction-valve by an eccentric-rod, and automatically varying

*a*, fly-wheel shaft; *a*, *b*, and *a*, *b'*, eccentricities in different positions of the eccentrics *c* and *d*. The eccentric *c* turns freely on the shaft *a*, and is actuated by links *e*, that are pivoted to cars formed on the eccentric, and are also pivoted to weights *f*. The weights have the form of curved bars, and are pivoted at one end to spokes of the wheel, as shown at *g*. The eccentric *d* is fitted to and turns freely upon the perimeter of the eccentric *c*. It is also connected by a link *h* to the toe of one of the weights, and is rotated on *c* by the motion of the weight toward or away from the center of the shaft *a*. The eccentric *c* is also rotated on the shaft *a* by the motion of the weights to or from the center of the shaft, but it is turned in a direction opposite to that in which *d* is turned. These two eccentricities, therefore, constitute a compound eccentric, the eccentricity or "throw" of which varies with the position of the weights, while the "lead" remains practically the same. Coiled springs *k* constantly press the weights *f* toward the center, and the action of these springs is more or less overcome by centrifugal force as the shaft *a* rotates with greater or less velocity. The higher the velocity the less will be the throw of the valve and the shorter the cut-off, and vice versa. Fig. 1 shows the weights in their extreme outward position, in which the throw *ab* is the least possible. Fig. 2 shows the extreme inward position of the weights, in which the throw *ab'* is the greatest possible. The range of variable cut-off is thus carried from simple lead to 0.7 of the stroke, and a very small percentage of change in the velocity is sufficient to change the cut-off from its least to its greatest limit.

the cut-off, maintaining a uniform speed of rotation under conditions of widely varying work. One of the most ingenious and scientific of this class is illustrated in the cut through an accompanying explanation. (4) A throttle-valve. (5) The induction-valve of a steam-engine. (6) The brake-band of a crab or crane which regulates the descent of a body raised by or suspended on a machine. (*b*) In heating apparatus: (1) A register. (2) A thermostat. (3) An automatic draft-damper for the furnace or fire-box of a steam-boiler. Also called *dampener-regulator*. (*c*) In *horol.*: (1) A clock of superior order, by comparison with which other time-pieces are regulated. (2) A clock which, being electrically connected with other clocks at a distance, causes them to keep time in unison with it. (3) A device (commonly a screw and small nut) by which the bob of a pendulum is raised or lowered, causing the clock to go faster or slower. (4) The fly of the striking mechanism of a clock. (See *fly*, 3(*a*)(1)). (5) A small lever which shortens or lengthens the hair-spring of a watch, thus causing the watch to go faster or slower according as the regulator is moved toward a part marked *F* or *S*. (*d*) In the electric light, the contrivance, usually an electromagnet, by which the carbon-points are kept at a constant distance, so that the light is steady (see *electric light*, under *electric*); or, in general, a contrivance for making the current produced by the dynamo-machines of constant strength.—**Many-light regulator**, a regulator for voltaic arc-lights, controlling numerous lights on one circuit.—**Regulator-box**. (*a*) A valve-chest or -box. (*b*) The original valve-motion of Watt's double-action condensing pumping-engine. It was a valve-box having a spindle through one of its sides, on which was a toothed sector working on a central bearing, and meshing with a rack attached to a valve. A tripping-lever attached to the sector and operated by the plug-tree caused the oscillations of the latter to open and close the valve.—**Regulator-cock**, one of the oil-cocks which admit oil to the steam-chest or valve-chest of a locomotive engine.—**Regulator-cover**, the cover or bonnet of a valve-chest or steam-chest of a steam-engine cylinder.—**Regulator-shaft and -levers**, in locomotive engines, the shaft and levers placed in front of the smoke-box when each cylinder has a separate regulator: now collectively

**reh** (rā), *n.* [Hind.] A saline efflorescence rising to the surface and covering various extensive tracts of land in the Indo-Gangetic alluvial plain, rendering the soil worthless for cultivation. It consists chiefly of sodium sulphate mixed with more or less common salt (sodium chloride) and sodium carbonate. It is known in the Northwest Provinces of India as *reh*, and further west, in the Upper Punjab, as *kalar* or *kullar*.

Those who have travelled through Northern India cannot fail to have noticed whole districts of land as white as if covered with snow, and entirely destitute of vegetation. . . . This desolation is caused by *reh*, which is a white flocculent efflorescence, formed of highly soluble sodium salts, which are found in almost every soil. Where the subsoil water-level is sufficiently near the surface, the strong evaporating force of the sun's heat, aided by capillary attraction, draws to the surface of the ground the water holding these salts in solution, and these compel the water, which passes off in the form of vapour, to leave behind the salts it held as a white efflorescence.

A. G. F. Eliot James, *Indian Industries*, p. 195.

**rehabilitate** (rē-hā-bil'i-tāt), *v. t.* [*< ML. rehabilitatus*, pp. of *rehabilitare* (*> It. riabilitare* = Sp. This old law-term (*rehabilitate*) has been gaining ground ever since it was introduced into popular discourse by Burke, to whom it may have been suggested by the French *réhabilitier*. Equally with its substantive, *rehabilitation*, it enables us to dispense with a tedious circumlocution.

A deer of the genus *Rangifer* or *Tarandus*, having horns in both sexes, and inhabiting arctic and cold temperate regions; the *Cervus tarandus*, *Rangifer tarandus*, or *Tarandus rangifer*.*

Reindeer (*Rangifer tarandus*).

It has branched, recurved, round antlers, the crowns of which are more or less palmated; the antlers of the male are much larger than those of the female, and are remarkable for the size and asymmetry of the brow-antler. The body is of a thick and square form, and the legs are shorter in proportion than those of the red-deer. The size varies much according to climate: about 4 feet 6 inches may be given as the average height of a full-grown specimen. The reindeer is keen of sight and swift of foot, being capable of maintaining a speed of 9 or 10 miles an hour for a long time, and can easily draw a weight of 200 pounds, besides the sledge to which it is usually attached when used as a beast of draft. Among the Laplanders the reindeer is a substitute for the horse, the cow, and the sheep, as it furnishes food, clothing, and the means of conveyance. The caribou of North America, if not absolutely identical with the reindeer, would seem to be at least a well-marked variety, usually called *R. caribou*. The American barren-ground reindeer has been described as a different species, *R. grantlandicus*. See also *caribou*.

3. A character of a plurality of things; a fact  
concerning two or more things, especially and  
more properly when it is regarded as a predi-  
cate of one of the things connecting it with the  
others; the condition of being such and such  
with regard to something else: as, the *relation*  
of a citizen to the state; the *relation* of demand  
and supply. Thus, suppose a locomotive blows off  
steam; this fact constitutes a relation between the loco-  
motive and the steam so far as the "blowing" is conceived  
to be a character of the locomotive, and another relation  
so far as the "being blown" is conceived as a character of  
the steam, and both these relations together are embraced  
in the same relationship, or plural fact. This latter, also  
often called a *relation*, is by logicians called the *founda-*  
*tion* of the relation. The two or more subjects or things  
to which the plural fact relates are termed the *relates* or  
*correlates*; the one which is conceived as subject is spe-  
cifically termed the *subject* of the relation, or the *relate*;  
the others the *correlates*. Words naming things in their  
character as *relates* are called *relatives*, as father, cousin.  
A set of relatives referring to the same relationship ac-  
cording as one or another object is taken as the *relate* are  
called *correlatives*: such are buyer, seller, commodity,  
price. The logical nomenclature of relations depends on  
the consideration of *individual relations*, or relations sub-  
sisting between the individuals of a single set of cor-  
relates, as opposed to *general relations*, which, really or in  
conception, subsist between many such sets. Relations are  
either *dual*—that is, connecting couples of objects, as in  
the examples above—or *plural*—that is, connecting more  
than two correlates, as the relation of a buyer to the  
seller, the thing bought, and the price. Every individual  
dual relation is either a relation of a thing to itself or a  
relation of a thing to something else. *Logical relations* are  
those which are known from logical reflection: opposed  
to *real relations*, which are known by generalization and  
abstraction from ordinary observations. The chief logi-  
cal relations are those of *impossibility*, *coexistence*,  
*identity*, and *otherness*. Real dual relations are of five  
classes: (1) *differences* or *dis-similitudes*, being relations  
which nothing can bear to itself, as being greater than;  
(2) *abi-relations* or *concurrences*, being relations which  
nothing can bear to anything else, as self-consciousness;  
(3) *agreements*, or relations which everything bears to it-  
self, as similarity; (4) relations which everything bears  
to everything else, which may be called *distances*; and  
(5) *var-form relations*, which some things only bear to  
themselves, and which subsist between some pairs of  
things only. Other divisions of relations are important in  
logic, as the following. An *iterative* or *repeating relation*  
is such that a thing may at once be in that relation and  
its converse to the same or different things, as the relation  
of father to son, or spouse to spouse: opposed to a *final*  
or *non-repeating relation*, as that of husband to wife. An  
*equiparance* or *convertible relation*, opposed to a *dis-sim-*  
*ilarity* or *inconvertible relation*, is such that, if anything  
is in that relation to another, the latter is in the same re-  
lation to the former, as that of cousins. A relation which  
cannot subsist between two things reciprocally, as that of  
greater and less, may be called an *irreciprocal relation*,  
opposed to a *reciprocal relation*, which admits recipro-  
cation as possible merely. A relation such that if A is so  
related to B, and B so related to C, then A is so related to  
C, is called a *transitive*, in opposition to an *intransitive re-*  
*lation*. A relation such that if A is so related to some-  
thing else, C, there is a third thing, B, which is so related  
to C, and to which A is so related, is called a *concatenated*,  
in opposition to an *inconcatenated relation*. A relation  
subsisting between objects in an endless or self-returning  
series is called an *inexhaustible*, in opposition to an *ex-*  
*haustible relation*. If there is a self-returning series, the  
relation is termed *cyclic*, in opposition to *acyclic*. A transi-  
tive relation such that of any two objects of a certain cat-  
egory one has this relation to the other may be called a  
*linear relation*; and the series of objects so formed may  
be called the *line* of the relation. According as this is  
continuous or discontinuous, finite or infinite, and in the  
latter case discretely or absolutely, these designations  
may be applied to the relation. According to the nom-  
inalistic (including the conceptualistic) view, a relation is  
a mere product of the mind. Adding to this doctrine that  
of the relativity of knowledge, that we know only relations,  
Kant reached his conclusion that things in themselves are  
absolutely incognizable. But most Kantian students come  
to deny the existence of things in themselves, and so reach  
an idealistic realism which holds relations to be as real as  
any facts. The realistic view is expressed in the dictum  
of Scotus that every relation without which, or a term of  
which, its foundation cannot be, is, in the thing (*relatū*),  
identical with that foundation—that is, what really is is

a fact relating to two or more things, and that fact viewed as a predicate of one of those things is the relation.

Thus is *relation* rect, ryht as adiectif and substantif A-cordeth in alle kyndes with his antecedent.

*Piers Plowman* (C), iv. 363.

The last sort of complex ideas is that we call *relation*, which consists in the consideration and comparing one idea with another. *Locke*, Human Understanding, II. 12.

The only difference between relative names and any others consists in their being given in pairs; and the reason of their being given in pairs is not the existence between two things of a mystical bond called a *relation* and supposed to have a kind of shadowy and abstract reality, but a very simple peculiarity in the concrete fact which the two names are intended to mark.

*J. S. Mill*, Note to James Mill's Human Mind, xiv. 2.

In natural science, I have understood, there is nothing petty to the mind that has a large vision of *relations*.

*George Eliot*, *Mill on the Floss*, iv. 1.

Most *relations* are feelings of an entirely different order from the terms they relate. The *relation* of similarity, e. g., may equally obtain between jasmine and tuberose, or between Mr. Browning's verses and Mr. Story's; it is itself neither odorous nor poetical, and those may well be pardoned who have denied to it all sensational content whatever.

*W. James*, Mind, XII. 13.

4. Intimate connection between facts; significant bearing of one fact upon another.

For the intent and purpose of the law  
Hath full *relation* to the penalty,  
Which here appeareth due upon the bond.

*Shak.*, *M. of V.*, iv. 1. 248.

The word *relation* is commonly used in two senses considerably different from each other. Either for that quality by which two ideas are connected together in the imagination, and the one naturally introduces the other . . . ; or for that particular circumstance in which . . . we may think proper to compare them. . . . In a common way we say that "nothing can be more distant than such or such things from each other, nothing can have less *relation*," as if distance and *relation* were incompatible.

*Hume*, Human Nature, part I. § 5.

5. Connection by consanguinity or affinity; kinship; tie of birth or marriage; relationship.

*Relations* dear, and all the charities

Of father, son, and brother, first were known.

*Milton*, P. L., iv. 768.

6. Kindred; connection; a group of persons related by kinship. [Rare.]

He hath need of a great stock of piety who is first to provide for his own necessities, and then to give portions to a numerous *relation*.

*Jer. Taylor*, Works (ed. 1836), I. 644.

7. A person connected by consanguinity or affinity; a kinsman or kinswoman; a relative.

Sir, you may spare your application,

I'm no such beast, nor his *relation*.

*Pope*, Imit. of Horace, I. vii. 60.

I am almost the nearest *relation* he has in the world, and am entitled to know all his dearest concerns.

*Jane Austen*, *Pride and Prejudice*, I. vi.

8. In *math.*: (a) A ratio; proportion. (b) A connection between a number of quantities by which certain systems of values are excluded; especially, such a connection as may be expressed by a plexus of general equations.—9. In *music*, that connection or kinship between two tones, chords, or keys (tonalities) which makes their association with each other easy and natural. The *relation* of tones is perceived by the ear without analysis. Physically it probably depends upon how far the two series of upper partial tones or harmonics coincide. Thus, a given tone is closely related to its perfect fifth, because the 2d, 5th, 8th, 11th, etc., harmonics of the one are respectively identical with the 1st, 3d, 6th, 7th, etc., of the other; while for converse reasons it is hardly at all related to its minor second. Tones that have but a distant relation to each other, however, are often both closely related to a third tone, and then, particularly if they are associated together in some melodic series, like a scale, may acquire a close relation. Thus, the seventh and eighth tones of a major scale have a close relation which is indirectly harmonic, but apparently due to their habitual melodic proximity. The relation of chords depends primarily on the identity of one or more of their respective tones. Thus, a major triad is closely related to a minor triad on the same root, or to a minor triad on the minor third below itself, because in each case there are two tones in common. Thus, the tonic triad of a key is related to the dominant and subdominant triads through the identity of one of its tones with one of theirs. As with tones, chords having but a distant relation to each other may acquire a relation through their respective close relations to a third chord, especially if habitually brought together in harmonic progressions. Thus, the dominant and subdominant triads of a key have a substantial but indirect relation; and, indeed, a relation is evident between all the triads of a key. The relation of keys (tonalities) depends properly on the number of tones which they have in common; though it is often held that a key is closely connected with every key whose tonic triad is made up of its tones. Thus, a major key is most intimately related to the major keys of its dominant and subdominant and to the minor key of its submediant, because each of them differs from it by but one tone, and also to the minor keys of its mediant and supertonic, because their tonic triads are also composed of its tones. Hence a major key and the minor key of its submediant are called mutually relative (*relative major* and *relative minor*), in distinction from the tonic major and tonic minor, which are more distantly related. When carefully analyzed, the fact of relation is

found to be profoundly concerned in the entire structure and development of music. It has caused the establishment of the major diatonic scale as the norm of all modern music. It is the kernel of tonality, of harmonic and melodic progression, of form in general, and of many extended forms in particular.

10. In *law*: (a) A fiction of law whereby, to prevent injustice, effect is given to an act done at one time as if it had been done at a previous time, it being said to have *relation* back to that time: as, where a deed is executed and acted on, but its delivery neglected, the law may give effect to its subsequent delivery by *relation* back to its date or to its execution, as may be equitable. (b) Suggestion by a relator; the statement or complaint of his grievance by one at whose instance an action or special proceeding is brought by the state to determine a question involving both public and private right.—11. In *arch.*, the direct dependence upon one another, and upon the whole, of the different parts of a building, or members of a design.—**Abelian relation**, a relation expressed by certain identical linear equations given by Abel connecting roots of unity with the roots of the equation which gives the values of the elliptic functions for rational fractions of the periods.—**Accidental relation**, an indirect relation of A to C, constituted by A being in some relation to B, and B being in an independent relation to C. Thus, if a man throws away a date-stone, and that date-stone strikes an invisible genie, the relation of the man to the genie is an accidental one.—**Actual relation**. See *actual*.—**Aggregate relation**. (a) A relation resulting from a disjunctive conjunction of several relations, such that, if any of the latter are satisfied, the aggregate relation is satisfied. (b) Same as *composite relation* (a). [This is the signification attached to the word by Cayley, contrary to the established terminology of logic.]—**Alio relation**, a relation of such a nature that a thing cannot be in that relation to itself: as, being previous to.—**Aptitudinal relation**. See *aptitudinal*.—**Categories of relation**. See *category*, 1.—**Composite relation**. (a) A relation consisting in the simultaneous existence of several relations. (b) Same as *aggregate relation* (a). [This is the signification attached to the phrase by Cayley, in opposition to the usage of logicians.]—**Confidential, cyclical, discriminant relation**. See the adjectives.—**Definite relation**, a relation unlike any relation of the same relate to other correlates. [This is Kempe's nomenclature, but is objectionable. *Peculiar* would better express the idea.]—**Distributively satisfied composite relation**. See *distributively*.—**Double relation, dual relation**, relation between a pair of things, or between a relate and a single correlate.—**Dynamic relations**. See *dynamic*.—**Enharmonic relation**. See *enharmonic*.—**Exterior relations**. See *exterior*.—**Extrinsic relation**, a relation which is established between terms already existing.—**False or inharmonic relation**, in *music*. See *false*.—**In relation to**, in the characters that connect the subject with the correlate which is the object of the preposition to: as, music in *relation* to poetry (music in those characters that connect it with poetry).—**Intrinsic relation**. See *intrinsic*.—**Involutorial relation**. See *involutorial*.—**Irregular relation**, a relation not regular.—**Jacobian relation**, the relation expressed by equating the Jacobian to zero.—**K-fold relation**, a relation which reduces by  $k$  the number of independent ways in which a system of quantities may vary.—**Legal relation**, the aggregate of legal rights and duties characterizing one person or thing in respect to another.—**Omal relation**, a relation expressed by a system of linear equations. [With Legendre, *omal* means having the differential coefficient constantly of one sign; but Cayley uses the word as a synonym of *homaloidal* or *linear*.]—**Order of a relation**, in *math*. See *order*, 12.—**Parametric relation**, a relation involving parameters, or variables over and above the coordinates.—**Flural relation**, a relation between a relate and two or more correlates, as when A aims a shot, B, at C.—**Predicamental relation**, a relation which comes under Aristotle's category of relation.—**Prime relation**, a relation not resulting from the conjunction of relations alternatively satisfied.—**Real relation**, a relation the statement of which cannot be separated into two facts, one relating to the relate and the other to the correlate, such as the relation of Cain to Abel as his killer. For the facts that Cain killed somebody and that Abel was killed do not together make up the fact that Cain killed Abel: opposed to *relation of reason*.—**Regular relation**, a relation of definite manifoldness. [So defined by Cayley; but it would have been better to denominate this a *homoplasial relation*, reserving the term *regular relation* for one which follows one law, expressible by general equations, for all values of the coordinates—this meaning according better with that usually given to *regular*.]—**Relation of disparagement**, a relation which confers unlike names upon relate and correlate.—**Relation of equiparance**, a relation which confers the same relative name upon relate and correlate: thus, the being a cousin of somebody is such a relation, for if A is cousin to B, B is cousin to A.—**Relation of reason**, a relation which depends upon a fact which can be stated as an aggregate of two facts (one concerning the relate, the other concerning the correlate), such that the annihilation of the relate or the correlate would destroy only one of these facts, but leave the other intact: thus, the fact that Franklin and Rumford were both scientific Americans constitutes a relationship between them with two correlative relations; but these are *relations of reason*, because the two facts are that Franklin was a scientific American and that Rumford was a scientific American, the first of which facts would remain true even if Rumford had never existed, and the second even if Franklin had never existed.—**Resultant relation**, a relation between parameters involved in a superdeterminate relation.—**Self-relation**. (a) A relation of such a sort that a thing can be in that relation to itself: as, being the killer of; but better (b) a relation of such a sort that nothing can be so related to anything else, as the relations of self-consciousness,

self-depreciation, self-help, etc.—**Superdeterminate relation**, a relation whose manifoldness is as great as or greater than the number of coordinates.—**Transcendental relation**, a relation which does not come under Aristotle's category of relation, as cause and effect, habit and object.—**Syn. 1. Narration, Recital**, etc. See *account*.—3. Attitude, connection.—5. Affiliation.—5 and 7. *Relation, Relative, Connection*. When applying to family affiliations, *relation* is used of a state or of a person, but in the latter sense *relative* is much better; *relative* is used of a person, but not of a state; *connection* is used with equal propriety of either person or state. *Relation* and *relative* refer to kinship by blood; *connection* is increasingly restricted to ties resulting from marriage.—6. Kindred, kin.

**relational** (rē-lā'shōn-al), a. [*< relation + -al*.]

1. Having relation or kindred.

We might be tempted to take these two nations for *relational* stems. *Tooke*.

2. Indicating or specifying some relation: used in contradistinction to *notional*: as, a *relational* part of speech. Pronouns, prepositions, and conjunctions are *relational* parts of speech.

**relationality** (rē-lā-shōn-al'i-ti), n. [*< relational + -ity*.] The state or property of having a relational force.

But if the remarks already made on what might be called the *relationality* of terms have any force, it is obvious that mental tension and conscious intensity cannot be equated to each other. *J. Ward*, Mind, XII. 56.

**relationism** (rē-lā'shōn-izm), n. [*< relation + -ism*.] 1. The doctrine that relations have a real existence.

*Relationism* teaches . . . that things and relations constitute two great, distinct orders of objective reality, inseparable in existence, yet distinguishable in thought.

*F. E. Abbot*, Scientific Theism, Introd., II.

2. The doctrine of the relativity of knowledge.

**relationist** (rē-lā'shōn-ist), n. [*< relation + -ist*.] 1. A relative; a relation. *Sir T. Browne*.

—2. An adherent of the doctrine of relationism.

**relationship** (rē-lā'shōn-ship), n. [*< relation + -ship*.] 1. The state of being related by kindred, affinity, or other alliance.

Faith is the great tie of *relationship* betwixt you [and Christ]. *Chalmers*, On Romans viii. 1 (ed. R. Carter).

Mrs. Mugford's conversation was incessant regarding the Ringwood family and Firmin's *relationship* to that noble house. *Thackeray*, Philip, xxi.

2. In *music*, same as *relation*, 8. Also called *tone-relationship*.

**relational** (rel-a-ti'val or rel-a-tiv-al), a. [*< relative + -al*.] Pertaining to relative words or forms.

Conjunctions, prepositions (personal, relative, and interrogative), *relational* contractions.

*E. A. Abbott*, Shakespearean Grammar (cited in The Nation, Feb. 16, 1871, p. 110).

**relative** (rel-a-tiv), a. and n. [*< ME. relatiif, < OF. (and F.) relatiif = Pr. relatiiv = Sp. Pg. It. relatiivo, < LL. relatiivus, having reference or relation, < L. relatus, pp. of referre, refer, relate: see refer, relate*.] I. a. 1. Having relation to or bearing on something; close in connection; pertinent; relevant; to the purpose.

The devil hath power

To assume a pleasing shape: yea, and perhaps . . .  
Abuses me to damn me. I'll have grounds  
More *relative* than this. *Shak.*, Hamlet, II. 2. 633.

2. Not absolute or existing by itself; considered as belonging to or respecting something else; depending on or incident to relation.

Everything sustains both an absolute and a *relative* capacity: an absolute, as it is such a thing, endowed with such a nature; and a *relative*, as it is a part of the universe, and so stands in such a relation to the whole.

*South*.

Not only simple ideas and substances, but modes also, are positive beings: though the parts of which they consist are very often *relative* one to another.

*Locke*, Human Understanding, II. xxvi. § 6.

Religion, it has been well observed, is something *relative* to us; a system of commands and promises from God towards us. *J. H. Newman*, Parochial Sermons, I. 317.

3. In *gram.*, referring to an antecedent; introducing a dependent clause that defines or describes or modifies something else in the sentence that is called the antecedent (because it usually, though by no means always, precedes the relative): thus, he *who* runs may read; he lay on the spot *where* he fell. Pronouns and pronominal adverbs are relative, such adverbs having also the value of conjunctions. A relative word used without an antecedent, as implying in itself its antecedent, is often called a *compound relative*: thus, *who* breaks pays; *I saw where* he fell. Relative words are always either demonstratives or interrogatives which have acquired secondarily the relative value and use.

4. Not intelligible except in connection with something else; signifying a relation, without stating what the correlate is: thus, *father*, *brother*, *west*, etc., are *relative* terms.

Profundity, in its secondary as in its primary sense, is a *relative* term. *Macaulay*, Sadler's Ref. Refuted.

**5. In music**, having a close melodic or harmonic relation. Thus, *relative chords*, in a narrow sense, the triads of a given key (tonality) having as roots the successive tones of its scale; *relative keys*, keys (tonalities) having several tones in common, thus affording opportunity for easy modulation back and forth, or, more narrowly, keys whose tonic triads are relative chords of each other; *relative major*, *relative minor*, a major key and the minor key of its submediant regarded with respect to each other. Also related, *parallel*. See cut under *chord*, 4.—**Relative beauty**, beauty consisting in the adaptation of the object to its end.—**Relative chronology**, in *geol.*, the geological method of computing time, as opposed to the *absolute* or *historical* method.—**Relative end**, *ens. equilibrium*. See the nouns.—**Relative enunciation**, an enunciation whose clauses are connected by a relative; as, "Wheresoever the carcass is, there will the eagles be gathered together."—**Relative gravity**. (a) The acceleration of gravity at a station referred to that at another station, and not expressed in terms of space and time. (b) Same as *specific gravity* (which see, under *gravity*).—**Relative ground**, of proof, premise which itself requires proof.—**Relative humidity**, *hypermetropia*, *locality*. See the nouns.—**Relative motion**. See *motion*.—**Relative opposites**, the two terms of any dual relation.—**Relative place**, the place of one object as defined by the situations of other objects.—**Relative pleasure** or *pain*, a state of feeling which is pleasurable or painful by force of contrast with the state which preceded it.—**Relative pronoun**, *proposition*, etc. See the nouns.—**Relative syllogism**, a syllogism whose major premise is a relative enunciation: as, Where Christ is, there will also the faithful be; but Christ is in heaven; therefore there also will the faithful be.—**Relative term**, a term which, to become the complete name of any class, requires to be completed by the annexation of another name, generally of another class: such terms are, for example, father of, the qualities of, tangent to, identical with, man that is, etc. Strictly speaking, all adjectives are of this nature.—**Relative time**, the sensible measure of any part of duration by means of motion.

**II. n. 1.** Something considered in its relation to something else; one of two things having a certain relation.—**2.** A person connected by blood or affinity; especially, one allied by blood; a kinsman or kinswoman; a relation.

Dissolv'd in tears to see us die.

Pomfret, Prospect of Death.

There is no greater bugbear than a strong-willed relative in the circle of his own connections.

Hawthorne, Seven Gables, xi.

**3. In gram.**, a relative word; a relative pronoun or adverb. See I., 3.—**4. In logic**, a relative term.—**Logic of relatives**, that branch of formal logic which treats of relations, and reasonings concerning them.—**Syn. 2.** Connection, etc. See *relation*.

**relatively** (rel'-a-tiv-ly), *adv.* In a relative manner; in relation or respect to something else; with relation to each other and to other things; not absolutely; comparatively: often followed by *to*: as, his expenditure in charity was large *relatively* to his income.—**Relatively identical**, the same in certain respects.—**Relatively prime**. See *prime*, 7.

**relativeness** (rel'-a-tiv-ness), *n.* The state of being relative or having relation.

Therefore, while for a later period of the dialect-life of Hellas the expression "dialect" is one of peculiar *relativeness*, it is a justifiable term for certain aggregations of morphological and syntactical phenomena in the earlier periods of language, when dialect-relations were more sharply defined.

Amer. Jour. Philol., VII. 444.

**relativity** (rel'-a-tiv'-i-ty), *n.* [= F. *relativité*, < NL. *relativitas* (-t-), < LL. *relativus*, relative: see *relative*.] **1.** The character of being relative; relativeness; the being of an object as it is by force of something to which it is relative. Specifically.—**2.** Phenomenality; existence as an immediate object of the understanding or of experience; existence only in relation to a thinking mind.—**The doctrine of the relativity of existence**, the doctrine that the real existence of the subject, and also of the object, depends on the real relation between them.—**The doctrine of the relativity of knowledge**. The phrase *relativity of knowledge* has received divergent significations. (a) The doctrine that it is impossible to have knowledge of anything except by means of its relations to the mind, direct and indirect, cognized as relations. (b) The doctrine of phenomenalism, that only appearances can be known, and that the relations of these appearances to external substrata, if such there be, are completely incognizable. This doctrine is sometimes associated with a denial of the possibility of any knowledge of relations as such, or at least of any whose terms are not independently present together in consciousness. It would therefore better be denominated *the doctrine of the impossibility of relativity of cognition*. (c) The doctrine that we can only become conscious of objects in their relations to one another. This doctrine is almost universally held by psychologists.

Relative and correlative are each thought through the other, so that in enunciating *relativity* as a condition of the thinkable—in other words, that thought is only of the relative—this is tantamount to saying that we think one thing only as we think two things mutually and at once; which again is equivalent to the doctrine that the absolute (the non-relative) is for us incognizable, and even inconceivable.

Sir W. Hamilton, Metaph., App. V. (c).

When a philosopher lays great stress upon the *relativity* of our knowledge, it is necessary to cross-examine his writings, and compel them to disclose in which of its many degrees of meaning he understands the phrase. . . .

To most of those who hold it, the difference between the Ego and the Non-ego is not one of language only, nor a formal distinction between two aspects of the same reality, but denotes two realities, each having a separate existence, and neither dependent on the other. . . . They believe that there is a real universe of "things in themselves," and that whenever there is an impression on our senses, there is a "thing in itself," which is behind the phenomenon, and is the cause of it. But as to what this thing is "in itself," we, having no organs except our senses for communicating with it, can only know what our senses tell us; and as they tell us nothing but the impression which the thing makes upon us, we do not know what it is in itself at all. . . . Of the ultimate realities, as such, we know the existence, and nothing more. . . . It is in this form that the *doctrine of the relativity of knowledge* is held by the greater number of those who profess to hold it, attaching any definite idea to the term.

J. S. Mill, Examination of Hamilton, II.

**relator** (rē-lā'tor), *n.* [*< F. relateur = Sp. Pg. relator = It. relatore, < L. relator, a relater, narrator, < relator, n. relatus, relate, etc.: see relate.*] **1.** Same as *relater*.

The objection, however, really has no philological justification, being based on an imperfect knowledge of the history and uses of the suffix -able, or on a too narrow view of its office. Compare available, conversable, dispensable, laughable, and many other examples collected by Fitzedward Hall in his work cited below, and see -able. As a matter of usage, however, the word is shunned by many fastidious writers.]

The Emperor of Russia may have announced the restoration of monarchy as exclusively his object. This is not considered as the ultimate object, by this country, but as the best means, and most reliable pledge, of a higher object, viz. our own security, and that of Europe.

*Shak., Hamlet, I. 1. 8.*

5. One who relieves another, as from a post of duty; a soldier who relieves another who is on guard; collectively, a company of soldiers who relieve others who are on guard.

Even in front of the National Palace the sentries on duty march up and down their beats in a slippish fashion, while the *reliefs* loiter about on the stone benches, smoking cigarettes and otherwise making themselves comfortable.

*Harper's Mag., LXXIX. 820.*

6. In *sculpt.*, *arch.*, etc., the projection (in painting, the apparent projection) of a figure or feature from the ground or plane on which it is formed. Relief is, in general, of three kinds: high relief (*alto-relievo*), low relief (*basso-relievo*, *bas-relief*), and middle or half relief (*mezzo-relievo*). The distinction lies in the degree of projection. High relief is that in which

High Relief.—The Rondonini mask of Medusa in the Glyptothek, Munich—illustrating the late beautified type of the Gorgon.

the figures project at least one half of their natural circumference from the background. In low relief the figures project but slightly from the ground, in such a manner that no part of them is entirely detached from it, as in medals, the chief effect being produced by the treatment of light and shadow. Middle or half relief is intermediate between the other two. The varieties of relief are still further distinguished as *staccato rilievo*, or very flat relief, the lowest possible relief, of which the projection in parts hardly exceeds the thickness of a sheet of paper; and *cavo-rilievo*, hollow relief, also called *intaglio rilievo*, or celsanaglyphic sculpture, an Egyptian form of relief obtained by cutting a furrow with sloping sides around a figure previously outlined on a stone surface, leaving the highest parts of the finished work on a level with the original surface-plane. See also cut in next column, and cuts under *orant*, *Proserpine*, *alto-rilievo*, and *bas-relief*.

You find the figures of many ancient coins rising up in a much more beautiful relief than those on the modern.

*Addison, Ancient Medals, III.*

7. A work of art or decoration in relief of any of the varieties described above.

Bas-relief or Cavo-rilievo Sculpture.—Court of Edfu, Egypt; Ptolemaic age, 3d century B. C.

8. In *her.*, the supposed projection of a charge from the surface of the field, represented by shading with a heavier bounding-line on the sinister side and toward the base than on the dexter side and toward the chief. Thus, if an escutcheon is divided into seven vertical stripes, alternately red and white, it would not be blazoned pale of seven gules and argent, as the rule is that pale is always of an even number, but the sinister side of three alternate stripes would be shaded to indicate relief, and the blazoning would be gules, three pallets argent, the assumption being that the pallets are in relief upon the field.

9. In *phys. geog.*, the form of the surface of any part of the earth, considered in the most general way, and with special regard to differences of elevation: little used except in the name *relief-map*, by which is meant a geographical or geological map in which the form of the surface is expressed by elevations and depressions of the material used. Unless the scale of such relief-maps is very large, there must be considerable exaggeration, because differences of vertical elevations in nature are small as compared with superficial extent. Relief-maps are occasionally made by preparing a model of the region it is desired to exhibit, and then photographing this model under an oblique illumination. The relief of the surface is also frequently indicated on maps by various colors or by a number of tints of one color. Both hachure and contour-line maps also indicate the relief of the surface, to a greater or less extent, according to their scale and artistic perfection. Thus, the Du-four map of Switzerland, especially when photographed down to a small size, has in a very striking degree the effect of a photograph from an actual model, although in reality a hachure-map.

10. In *fort.*, the perpendicular height of the interior crest of the parapet above the bottom of the ditch.—11. Prominence or distinctness given to anything by something presenting a contrast to it, or brought into close relation with or proximity to it; a contrast.

13. What is picked up; fragments left; broken meat given in alms.

After dener, ther shall come all fire sowerys, and take the *relief* of the mete and drynke that the forsayde M. and shopholders levyth. *English Gilda (E. E. T. S.), p. 315.*

14. In *law*, that which a court of justice awards to a suitor as redress for the grievance of which he complains.—15. In *feudal law*, a fine or composition which the heir of a tenant holding by knight's service or other tenure paid to the lord at the death of the ancestor, for the privilege of succeeding to the estate, which, on strict feudal principles, had lapsed or fallen to the lord on the death of the tenant. This relief consisted of horses, arms, money, etc., the amount of which was originally arbitrary, but afterward fixed by law. The term is still used in this sense in Scots law, being a sum exigible by a feudal superior from the heir who enters on a feu. Also called *casualty of relief*.

On taking up the inheritance of lands, a *relief* [was paid to the king]. The *relief* originally consisted of arms, armour and horses, and was arbitrary in amount, but was subsequently "ascertained," that is, rendered certain, by the Conqueror, and fixed at a certain quantity of arms and habiliments of war. After the assize of arms of Henry II., it was commuted for a money payment of 100s. for every knight's fee, and as thus fixed continued to be payable ever afterwards. *S. Dowell, Taxes in England, I. 25.*

Absolute relief, in *fort.*, the height of any point of a work above the bottom of the ditch.—Alternative relief, in *law*, different modes of redress asked in the alternative, usually because of uncertainty as to some of the facts, or because of a discretionary power in the court to award either.—Bond of relief. See *bond*.—Constructive relief, in *fort.*, the height of any point of a work above the plane of construction.—Conversion of relief. relief-perspective (rē-lēf'pēr-spek'tiv), *n.* The art of constructing homological figures in space, and of determining the relations of the parts of bas-reliefs, theatrical settings, etc., to make them look like nature. Every such representation refers to a fixed center of perspective and to a fixed plane of homology. The latter in a theater setting is the plane in which the actors generally stand; in a bas-relief it is the plane of life-size figures. Every natural plane is represented by a plane cutting it in a line lying in the plane of homology. Every natural point is represented by a point in the same ray from the center of perspective. The plane of homology represents itself, and the center of perspective represents itself. One other point can be taken arbitrarily to represent a given point. There is a vanishing plane, parallel to the plane of homology, which represents the portions of space at an infinite distance.

See *establishment*. 6.—**Evidences of revealed religion.** See *evidences of Christianity*, under *Christianity*.—**Experimental religion.** See *experimental*.—**Natural religion**, that knowledge of and reverent feeling toward God, and that knowledge and practice of our duties toward our fellow-men, which is based on and derived from nature, apart from revelation.—**Religion of Humanity.** See *positive philosophy*, under *positive*.—**Revealed religion**, that knowledge of God and right feeling toward him, and that recognition and practice of duty toward our fellow-men, which is derived from and based upon positive revelation.—**To experience religion.** See *experience*.—**To get religion.** See *get*.—Syn. 1. *Religion*, *Devotion*, *Piety*, *Sanctity*, *Saintliness*, *Godliness*, *Holiness*, *Religiosity*. In the subjective aspect of these words *religion* is the most general, as it may be also the most formal or external; in this sense it is the place of the will and character of God in the heart, so that they are the principal object of regard and the controlling influence. *Devotion* and *piety* have most of fervor. *Devotion* is a religion that consecrates itself, being both a close attention to God with complete inward subjection and an equal attention to the duties of religion. *Piety* is religion under the aspect of filial feeling and conduct, the former being the primary idea. *Sanctity* is generally used objectively; subjectively it is the same as *holiness*. *Saintliness* is more concrete than *sanctity*, more distinctly a quality of a person, likeness to a saint, ripeness for heaven. *Godliness* is higher than *saintliness*; it is likeness to God, or the endeavor to attain such likeness, fixed attention given immediately to God, especially obedience to his will and endeavor to copy his character. *Holiness* is the most absolute of these words; it is moral and religious wholeness, completeness, or something approaching so near to absolute freedom from sin as to make the word appropriate; it includes not only being free from sin, but refusing it and hating it for its own sake. *Religiosity* is not a very common nor a very euphonious word, but seems to meet a felt want by expressing a susceptibility to the sentiments of religion, awe, reverence, admiration for the teachings of religion, etc., without much disposition to obey its commands.

'to pin one's faith to a thing,' 'a man to tie to,' colloquial phrases containing the same figure); in this use it became, by omission of the object, intransitive, and, losing thus its etymological associations (the other use, 'bring together again, rally,' having also become obsolete), was sometimes regarded, and has been by some etymologists actually explained, as a barbarous compound of *re-* + *E. lie*<sup>1</sup>, rest, whence appar. the occasional physical use (def. The last *remainders* of unhappy Troy?  
*Dryden*, Æneid, v.

2. In *math.*, the sum or quantity left after subtraction or after any deduction; also, the part remaining over after division: thus, if 19 be divided by 4, the *remainder* is 3, because 19 is three more than an exact multiple of 4. In the old arithmetics called the *remainder*.—3. In *law*, a future estate so created as to take effect in possession and enjoyment after another estate (as a life-interest) is determined; a remnant of an estate in land, depending upon a particular prior estate, created at the same time, and by the same instrument, and limited to arise immediately on the determination of that estate. (*Kent*.) It is thus distinguished from a *reversion*, which is the estate which by operation of law arises in the grantor or his heirs when a limited estate created without creating also a remainder comes to an end; and distinguished also from an *executory interest*, which may take effect although there be no prior estate upon the termination of which it is to commence in possession. At the time when by the common law no grant could be made

but by livery of seisin, a person who wished to give to another a future estate was obliged to create at the same time an intermediate estate commencing immediately, and he could limit this temporary estate by the event which he wished to fix for the commencement of the ultimate estate, which was hence called the *remainder*—that is, what remained after the precedent or particular estate—and was said to be supported by the precedent or particular estate. (See *particular estate* and *executory estate*, both under *estate*.) A remainder is *vested* when the event which will terminate the precedent estate is certain to happen, and the person designated to take in remainder is in existence. The fact that the person may not survive to enjoy the estate, or that others may come into existence who will also answer the designation and therefore be entitled to share it with him, does not prevent the *remainder* from being deemed vested meanwhile.

With Julius Caesar, Decimus Brutus had obtained that interest, as he set him down in his testament for heir in *remainder* after his nephew. *Bacon*, Friendship (ed. 1887).

4. In the publishing trade, that which remains of an edition the sale of which has practically ceased, and which is sold out at a reduced price.

In 1848 he felt strong enough to start as a publisher in Soho Square, his main dealings before this having been in *remainders*, and his one solitary publication a failure.  
*Athenæum*, No. 3191, p. 850.

*Contingent remainder*, in *law*, a remainder which is not vested. The epithets *contingent* and *vested* are, however, often loosely used to indicate the distinction between remainders of which the enjoyment is in any way contingent and others.—*Cross remainder*, in *law*, that state of affairs in which each of two grantees or devisees has reciprocally a remainder in the property in which a particular estate is given to the other. Thus, if land be devised, one half to A for life with remainder to B in fee simple, and the other half to B for life with remainder to A in fee simple, these remainders are called *cross remainders*. *Cross remainders* arise on a grant to two or more as tenants in common, a particular estate being limited to each of the grantees in his share, with remainders to the other or others of them.—Syn. 1. *Rest*, *Remainder*, *Remnant*, *Residue*, *Balance*. *Rest* is the most general term; it may represent a large or a small part. *Remainder* and *residue* generally represent a comparatively small part, and *remnant* a part not only very small, but of little or no account. *Rest* may be applied to persons as freely as to things; *remainder* and *residue* only to things; but we may speak of the *remainder* of a party. *Remnant* and *residue* are favorite words in the Bible for *rest* or *remainder*, as in Mat. xxiii. 6 and Isa. xxi. 17, but such use of them in application to persons is now antique. *Balance* cannot, literally or by legitimate figure, be used for *rest* or *remainder*: we say the *balance* of the time, week, space, party, money. It is a cant word of trade.

4. In *line-engraving* and *etching*: (a) A distinguishing mark or peculiarity of any kind, indicating any particular state of the plate prior to its completion. The *remark* may be a slight sketch made by the engraver on the margin of his plate, or it may consist merely in the absence of certain detail or features of the finished work. Thus, in a first proof of an etching the absence of retouching with the dry point, or of a final retouching, constitutes a *remark*; or in a line-engraving it may consist in the presence or absence of some minor ob-

ject, or of certain lines representing texture or shading, which in a later state of the plate are removed or added.

The old legend still lingers that the *remarque* began when some unknown etcher tried his point upon the edge of his plate just before taking his first impressions. The belief yet obtains that the *remarque* testifies to the etcher's supreme satisfaction with a supreme effort. But as a matter of fact the *remarque* has become any kind of a fanciful supplementary sketch, not necessarily appropriate, not always done by the etcher, and appearing upon a number of impressions which seem to be limited only at the will of artist or dealer. Sometimes we see 50 *remarque* proofs announced, and again 800.

*New York Tribune*, Feb. 6, 1887.

(b) A print or proof bearing or characterized by a *remark*; a remarked proof, or remark proof. Also written *remarque*. — *Syn.* 2. *Remark*, *Observation*, *Comment*, *Commentary*, *Reflection*, *Note*, *Annotation*, *Gloss*. A *remark* is brief and cursory, suggested by present circumstances and presumably without previous thought. An *observation* is made with some thought and care. A *comment* is a remark or observation bearing closely upon some situation of facts, some previous utterance, or some published work. *Remark* may be substituted by modesty for *observation*. When printed, *remarks*, *observations*, or *comments* may be called *reflections*: as, Burke's "*Reflections* on the Revolution in France"; when they are systematic in explanation of a work, they may be called a *commentary*: as, Lange's "*Commentary* on Matthew." A *note* is primarily a brief writing to help the memory; then a marginal comment: *notes* is sometimes used modestly for *commentary*: as, Barnes's "*Notes* on the Psalms"; Trench's "*Notes* on the Parables." A marginal comment is more definitely expressed by *annotation*. A *gloss* is a comment made for the purpose of explanation, especially upon a word or passage in a foreign language or a peculiar dialect.

1. *n.* A new birth; hence, the revival of anything which has long been in decay or desuetude. Specifically [*cap.*], the movement of transition in Europe from the medieval to the modern world, and especially the time, spirit, and activity of the revival of classical arts and letters. The earliest traces and most characteristic development of this revival were in Italy, where Petrarch and the early humanists and artists of the fourteenth century may be regarded as its precursors. The movement was greatly stimulated by the influx of Byzantine scholars, who brought the literature of ancient Greece into Italy in the fifteenth century, especially after the taking of Constantinople by the Turks in 1453. The Italian Renaissance was at its height at the end of the fifteenth and in the early sixteenth century, as seen in the lives and works of such men as Lorenzo dei Medici, Michelangelo, Leonardo da Vinci, Raphael, Machiavelli, Politián, Ariosto, Correggio, Titian, and Aldus Manutius. The Renaissance was aided everywhere by the spirit of discovery and exploration of the fifteenth century—the age which saw the invention of printing, the discovery of America, and the rounding of Africa. In Germany the Renaissance advanced about the same time with the Reformation (which commenced in 1517). In England the revival of learning was fostered by Erasmus, Colet, Grocyn, More, and their fellows, about 1500, and in France there was a brilliant artistic and literary development under Louis XII. (1498–1515) and Francis I. (1515–47). Also, in English form, *renaissance*.

I have ventured to give to the foreign word *renaissance*—destined to become of more common use amongst us as the movement which it denotes comes, as it will come, increasingly to interest us—an English form [*Renascence*].  
*M. Arnold, Culture and Anarchy, iv., note.*

The Renaissance and the Reformation mark the return to experience. They showed that the doctrine of reconciliation was at last passing from the abstract to the concrete.  
*E. Caird, Philoa. of Kant, p. 28.*

II. *a.* [*cap.*] Of or pertaining to the Renaissance; in the style of the Renaissance.—**Renaissance architecture**, the style of building and decoration which succeeded the medieval, and was based upon study and emulation of the outward forms and ornaments of Roman art, though with imperfect understanding of their principles. This style had its origin in Italy in the first half of the fifteenth century, and afterward spread over Europe. Its main characteristic is an attempted return to the classical forms which had been the forerunners of the Byzantine and the medieval. The Florentine Brunelleschi (died about 1446) was one of the first masters of the style, having prepared himself by earnest study of the remains of the monuments of ancient Rome. From Florence the style was introduced into Rome, where the works of Bramante (died 1514) are among its finest examples, the chief of these being the palace of the Chancery, the foundations of St. Peter's, part of the Vatican, and the small church of San Pietro in Montorio. One of the greatest achievements of the Renaissance is the dome of St. Peter's, the work of Michelangelo; but this must yield in grandeur of conception to the earlier Florentine dome of Brunelleschi. After Michelangelo the style declined rapidly. Another chief Renaissance school arose in Venice, where in the majority of the buildings of the sixteenth and seventeenth centuries predominance is given to external decoration. From this school sprang Palladio (1518–1580), whose distinctive style of architecture received the name of *Palladian*. Renaissance architecture was introduced into France by Lombardic and Florentine architects at the beginning of the sixteenth century, and flourished there during that century, but especially in the first half, under Louis XII. and Francis I.

During the seventeenth century the style degenerated in France, as it had in Italy, and gave rise to the inorganic and insipid productions of the so-called *rococo* or Louis XV. style of the first half of the eighteenth century.

**Renaissance Architecture.**—French Renaissance tomb of Loys de Brézé (died 1531), Grand Seneschal of Normandy, etc., in the cathedral of Rouen; erected by his wife, Diane de Poitiers, and attributed to Jean Goujon and Jean Cousin.

In England the Renaissance style was introduced later than in France, and it is represented there by the works of Inigo Jones, Sir Christopher Wren, and their contemporaries.—St. Paul's, London, being a grand example by Wren. While all Renaissance architecture is far inferior to medieval building of the best time, it represents a distinct advance over the debased and over-elaborated forms of the medieval decadence. For an Italian example, see cut under *Italian*; see also cuts under *loggia* and *Palladian*.—**Renaissance braid-work**, a kind of needlework similar in its make to needle-point lace, but of much stouter material, as fine braid.—**Renaissance lace**, same as *Renaissance braid-work*.—**Renaissance painting**, next to architecture the chief art of the Renaissance, had by far its most important and characteristic development in Italy, where, based upon the art of the Byzantine painters of the middle ages, a number of important art-centers or schools arose, differing from one another in their ideals and methods, but all distinctively Italian. The central one of these schools was that of Florence, which took the lead under the impulse and example of the great artist Giotto in the early part of the fourteenth century. Among the greatest of those after Giotto, whose genius influenced the development of the art, were Fra Angelico (Fra Giovanni da Fiesole), Masolino, Masaccio, Filippo Lippi, Sandro Botticelli, Filippino Lippi, and Leonardo da Vinci. The chief glory of Renaissance painting is that it advanced that art beyond any point that it had attained before, or has since reached. For other schools of Renaissance painting, see *Bolognese*, *Roman*, *Siennese*, *Umbrian*, *Venetian*; and see *Italian painting*, under *Italian*.—**Renaissance sculpture**, the sculpture of the Renaissance, characterized primarily by seeking its models and

inspiration in the works of Roman antiquity, instead of in contemporary life, like medieval sculpture. As an adjunct to architecture, this sculpture reached its highest excellence in Italy and in France. Eminent names are those

of Niccolò Pisano, Donatello, Ghiberti, Luca della Robbia, Sansovino, Sangallo, and Michelangelo (1475–1564), one of the half-dozen names that rank as greatest in the world's art-history. See cut of Benvenuto Cellini's "Perseus and Medusa," under *Perseus*, and see, under *quadra*, another example by Luca della Robbia.—**Renaissance style**, properly the style of art and decoration (see *Renaissance architecture*) which prevailed in Italy during the fifteenth century and later, and the styles founded upon these which were in vogue in northern Europe at a date somewhat later—as in France from about 1520 to 1560. By extension the phrase is made to cover all the revived classic styles of the last four centuries, including the above, and to embrace everything which shows a strong classic influence. This use is generally avoided by French writers, who speak of the styles following the religious wars in France as the styles of Henry IV., Louis XIII., etc., excluding these from the Renaissance style proper; but English writers commonly include the whole period from 1400 to the French Revolution or the end of the eighteenth century, and divide it into various epochs or subordinate styles, according to the writer's fancy.

Chop.* In garments we *rip* along the line at which they were sewed: we *tear* the texture of the cloth; we say, "It is not *torn*: it is only *ripped*." More broadly, *rip*, especially with *up*, stands for a cutting open or apart with a quick, deep stroke: as, to *rip up* a body or a sack of meal. *Rend* implies great force or violence. To *split* is primarily to divide lengthwise or by the grain: as, to *split* wood. *Cleave* may be a more dignified word for *split*, or it may express a cutting apart by a straight, heavy stroke. *Fracture* may represent the next degree beyond cracking, the lightest kind of breaking, leaving the parts in place: as, a *fractured* bone or plate of glass; or it may be a more formal word for *break*. To *chop* is to cut apart with a heavy stroke, which is generally across the grain or natural cleavage, or through the narrow dimension of the material: *chopping* wood is thus distinguished from *splitting* wood.

(b) Technically, a definite compensation or return reserved by a lease, to be made periodically, or fixed with reference to a period of tenure, and payable in money, produce, or other chattels or labor, for the possession and use of land or buildings. Compensation of any other nature is not termed *rent*, because not enforceable in the same manner. The time of paying rents is either by the particular appointment of the parties in the deed, or by appointment of law, but the law does not control the express appointment of the parties, when such appointment will answer their intention. In England Michaelmas and Lady-day are the usual days appointed for payment of rents; and in Scotland Martinmas and Whitsunday.

Take (dear Son) to thee  
This Farm's demains, . . .  
And th' only *Rent* that of it I reserve is

*Encyc. Brit.*, XIV. 275.

(c) The right to such compensation, particularly in respect of lands. Rents at common law, are of three kinds: *rent-service*, *rent-charge* or *fee-farm*

**rent**, and **rent-sock**. *Rent-service* is when some corporal service is incident to it, as by fealty and a sum of money; *rent-charge*, or *fee-farm rent*, is when the owner of the rent has no future interest or reversion expectant in the land, but the rent is reserved in the deed by a clause of distress for rent in arrear (in other words, it is a charge on lands, etc., in the form of rent, in favor of one who is not the landlord); *rent-sock* is a like rent, but without any clause of distress. There are also *rents of assize*, certain established rents of freeholders and copyholders of manors, which cannot be varied: also called *quit-rents*. These, when payable in silver, are called *white rents*, in contradistinction to rents reserved in work or the baser metals, called *black rents* or *black mail*.

3. In *polit. econ.*, that part of the produce of the soil which is left after deducting what is necessary to the support of the producers (including the wages of the laborers), the interest on the necessary capital, and a supply of seed for the next year; that part of the produce of a given piece of cultivated land which it yields over and above that yielded by the poorest land in cultivation under equal circumstances in respect to transportation, etc. The rent theoretically goes to the owner of the soil, whether cultivator or landlord. Also called *economic rent*.

*Rent* is that portion of the produce of the earth which is paid to the landlord for the use of the original and indestructible powers of the soil. It is often, however, confounded with the interest and profit of capital, and, in popular language, the term is applied to whatever is annually paid by a farmer to his landlord. *Ricardo*, *Pol. Econ.*, II.

The *rent*, therefore, which any land will yield, is the excess of its produce beyond what would be returned to the same capital if employed on the worst land in cultivation. *J. S. Mill*, *Pol. Econ.*, II. xvi. § 3.

*Rent* is that portion of the regular net product of a piece of land which remains after deducting the wages of labor and the interest on the capital usual in the country incorporated into it.

*W. Roscher*, *Pol. Econ.* (trans.), II. § 140.

No part of *Ricardo's* theory is more elementary or more unchallenged than this, that the *rent* of land constitutes no part of the price of bread, and that high *rent* is not the cause of dear bread, but dear bread the cause of high *rent*. *Rae*, *Contemporary Socialism*, p. 428.

=*Syn.* *Repentance*, *Penitence*, *Contrition*, *Compunction*, *Regret*, *Remorse*, may express the sorrowful feeling of the wrong-doer in view of his conduct. *Regret* is quite as often used of wishing that one had not done that which is unwise; as applied to misconduct, it expresses the feeblest degree of sorrow for doing wrong; but it may contain no element of real *repentance*. *Repentance* goes beyond feeling to express distinct purposes of turning from sin to righteousness; the Bible word most often translated *repentance* means a change of mental and spiritual attitude toward sin. Strictly, *repentance* is the beginning of amendment of life; the word does not imply any greater degree of feeling than is necessary to bring about a change, whether the turning be from a particular sin or from an attitude of sin. *Penitence* implies a large measure of feeling, and applies more exclusively than *repentance* to wrong-doing as an offense against God and right. *Contrition*, literally breaking or bruising, is essentially the same as *penitence*; it is a deep, quiet, and continued sorrow, chiefly for specific acts. *Compunction*, literally pricking, is a sharp pang of regret or self-reproach, often momentary and not always resulting in moral benefit. It is more likely than remorse to result in good. *Remorse*, literally gnawing, is naturally sharper mental suffering than *compunction*; the word often suggests a sort of spiritual despair or hopelessness, paralyzing one for efforts to attain *repentance*.

*repentant* (rē-pen'tant), *a.* and *n.* [*< ME. repentant*, *< OF. repentant*, *repentant*, *penitent*, *< ML. repeniten(t)-s*, ppr. of *\*repentere*, *repent*; see *repent*<sup>1</sup>.] 1. *a.* 1. Experiencing repen-

**representant** (rep-rê-zen'tant), *a. and n.* [*< F. représentant, ppr. of représenter, represent, = Sp. Pg. ppr. representante = It. rappresentante, rappresentante, < L. representant(i)-s, ppr. of rappresentare, represent: see represent.*] I. *a.* Representing; having vicarious power.

*sent.*] 1. The act of presenting again.—2. The act of presenting to the mind or the view; the act of portraying, depicting, or exhibiting, as in imagination, in a picture, or on the stage; portrayal.

The act of Representation is merely the energy of the mind in holding up to its own contemplation what it is determined to represent. I distinguish, as essentially different, the Representation and the determination to represent.  
*Sir W. Hamilton, Metaphysica, xxiv.*

The author [Thomas Bently] . . . sent this piece ["The Wishes"] first to Garrick, who very properly rejected it as unfit for representation.

*W. Cooke, Memoirs of S. Foote, l. 63.*

*Godwin, Fleetwood, vii.*

4. A statement or an assertion made in regard to some matter or circumstance; a verbal description or statement: as, to obtain money by false representations. Specifically—(a) In insurance and law, a verbal or written statement made on the part of the insured to the insurer, before or at the time of the making of the contract, as to the existence of some fact or state of facts tending to induce the insurer more readily to assume the risk, by diminishing the estimate he would otherwise have formed of it. It differs from a warranty and from a condition expressed in the policy, in being part of the preliminary proceedings which propose the contract, and its falsity does not vitiate the contract unless made with fraudulent intent or perhaps with respect to a material point; while the latter are part of the contract when completed, and non-compliance therewith is an express breach which of itself avoids the contract. (b) In Scots law, the written pleading presented to a lord ordinary of the Court of Session when his judgment is brought under review.

5. An expostulatory statement of facts, arguments, or the like; remonstrance.

He threatened "to send his jack-boot to rule the country," when the senate once ventured to make a representation against his ruinous policy.  
*Brougham.*

6. In psychol., the word chiefly used to translate the German *Vorstellung*, used in that language to translate the English word *idea*. See *idea*, 2 and 3. (a) The immediate object of cognition; anything that the soul is conscious of. This is now the commonest meaning of *Vorstellung*, and recent translators have most frequently rendered it by the word *idea*. (b) A reproduced perception.

The word representation I have restricted to denote, what it only can in propriety express, the immediate object or product of imagination.

*Sir W. Hamilton, Logic, vii.*

If all reasoning be the re-representation of what is now absent but formerly was present and can again be made present—in other words, if the test of accurate reasoning is its reduction to fact—then is it evident that Philosophy, dealing with transcendental objects which cannot be present, and employing a method which admits of no verification (or reduction to the test of fact), must be an impossible attempt.  
*G. H. Lewes.*

It is quite evident that the growth of perception involves representation of sensations; that the growth of simple reasoning involves representation of perceptions; and that the growth of complex reasoning involves representation of the results of simple reasoning.

*H. Spencer, Prin. of Psychol., § 482.*

Assimilation involves retentiveness and differentiation, as we have seen, and prepares the way for re-representation; but in itself there is no confronting the new with the old, no determination of likeness, and no subsequent classification.  
*J. Ward, Encyc. Brit., XX. 53.*

7. In law: (a) The standing in the place of another, as an heir, or in the right of taking by inheritance; the personating of another, as an heir, executor, or administrator. (b) More specifically, the coming in of children of a deceased heir apparent, devisee dying before the testator, etc., to take the share their parent would have taken had he survived, not as succeeding as the heirs of the parent, but as together representing him among the other heirs of the ancestor. See *representative*, *n.*, 3. In Scots law the term is usually applied to the obligation incurred by an heir to pay the debts and perform the obligations incumbent upon his predecessor.

8. Share or participation, as in legislation, deliberation, management, etc., by means of regularly chosen or appointed delegates; or, the system by which communities have a voice in the direction of their own affairs, and in the making of their own laws, by means of chosen delegates: as, parliamentary representation.

*Burke.*

He [Daniel Cookin] was the originator and the prophet of that immortal dogma of our national greatness—no taxation without representation.

M. C. Tyler, *Amer. Lit.*, I. 154.

As for the principle of representation, that seems to have been an invention of the Teutonic mind; no statesman of antiquity, either in Greece or at Rome, seems to have conceived the idea of a city sending delegates armed with plenary powers to represent its interests in a general legislative assembly.

J. Fiske, *Amer. Pol. Ideas*, p. 59.

In these small [Grecian] commonwealths representation is unknown; whatever powers may be entrusted to individual magistrates or to smaller councils, the supreme authority must rest with an assembly in which every qualified citizen gives his vote in his own person.

E. A. Freeman, *Amer. Lects.*, p. 248.

9. A representative or delegate, or a number of representatives collectively.

The representations of the people are most obviously susceptible of improvement. J. Adams, *Works*, IV. 284.

Proportional representation, representation, as in a political assembly, according to the number of electors, inhabitants, etc., in an electoral district or other unit. This principle is recognized in the United States House of Representatives and in many other bodies, especially those of a popular character.—Pure representation. See *pure*.—Syn. S. Show; delineation, portraiture, likeness, resemblance.

**representational** (rep-rē-zen-tā'shon-əl), *a.* [*< representation + -al.*] Pertaining to or containing representation, in any sense; of the nature of representation.

We find that in "constructive imagination" a new kind of effort is often requisite in order to dissociate these representational complexes as a preliminary to new combinations. J. Ward, *Encyc. Brit.*, XX. 57.

**representational** (rep-rē-zen-tā'shon-ā-ri), *a.* [*< representation + -ary.*] Of or pertaining to representation; representative: as, a *representational* system of government. [Rare.] *Imp. Dict.*

**representationism** (rep-rē-zen-tā'shon-izm), *n.* [*< representation + -ism.*] The doctrine, held by Descartes and others, that in the perception of the external world the immediate object of consciousness is vicarious, or representative of another and principal object beyond the sphere of consciousness.—Egotistical representationism. See *egotistic*.

**representationist** (rep-rē-zen-tā'shon-ist), *n.* [*< representation + -ist.*] One who holds the doctrine of representationism.

The representationists, as denying to consciousness the cognizance of aught beyond a merely subjective phenomenon, are likewise idealists; yet, as positing the reality of an external world, they must be distinguished as cosmotic idealists. Hamilton, *Reid's Works*, Note C, § 1.

**representative** (rep-rē-zen-tā-tiv), *a.* and *n.* [*< F. représentatif = Sp. representativo = It. rappresentativo, < ML. representativus, < L. representare, represent; see represent.*] I. *a.* 1. Representing, portraying, or typifying.

Representative [poesy] is as a visible history, and is an image of actions as if they were present, as history is of actions in nature as they are, (that is) past.

Bacon, *Advancement of Learning*, II.

They relieve themselves with this distinction, and yet own the legal sacrifices, though representative, to be proper and real. Bp. Atterbury.

Men have a pictorial or representative quality, and serve us in the intellect. Behmen and Swedenborg saw that things were representative. Men are also representative—first, of things, and, secondly, of ideas.

Emerson, *Representative Men*, p. 14.

2. Acting as the substitute for or agent of another or of others; performing the functions of another or of others.

This council of four hundred was chosen, one hundred out of each tribe, and seems to have been a body representative of the people. Swift.

The more multitudinous a representative assembly may be rendered, the more it will partake of the infirmities incident to collective meetings of the people.

A. Hamilton, *Federalist*, No. 58.

3. Pertaining to or founded on representation of the people; conducted by the agency of delegates chosen by or representing the people: as, a *representative* government.

A representative government, even when entire, cannot possibly be the seat of sovereignty—the supreme and ultimate power of a State. The very term representative implies a superior in the individual or body represented.

Cathoun, *Works*, I. 190.

He [Cromwell] gave the country a constitution far more perfect than any which had at that time been known in the world. He reformed the representative system in a manner which has extorted praise even from Lord Clarendon.

Macaulay.

4. In *biol.*: (a) Typical; fully presenting, or alone representing, the characters of a given class or group: as, in zoölogy and botany, the *representative* genus of a family.

No one human being can be completely the representative man of his race. Palgrave. (*Latham*.)

(b) Representing in any group the characters of another and different group: chiefly used in the quinary system; also, pertaining to such supposed representation: as, the *representative* theory. (c) In zoögeography, replacing; taking the place of, or holding a similar position: as, the llama is *representative* of the camel in America.—5. In *psychol.* and *logic*, mediately known; known by means of a representation or object which signifies another object.

The chief merit or excellence of a *representative* image consists in its distinctness or clearness.

J. Sully, *Outlines of Psychol.*, p. 227.

*Representative* cognitions, or those in which consciousness is occupied with the relations among ideas or represented sensations, as in all acts of recollection.

H. Spencer, *Prin. of Psychol.*, § 480.

**Representative being**, being as an immediate object of consciousness.—**Representative faculty**, the faculty of representing images which the reproductive faculty has evoked; the imagination.—**Representative function**, a function having the properties of  $\phi(a, n)$ , stated below, under *representative integral*.—**Representative integral**, an integral of the form

$$\int_a^b f_a \cdot \phi(a, n) \cdot da,$$

where  $f_a$  is a function of limited variation between  $A$  and another limit  $B$ , exceeding  $B$ , while  $\phi(a, n)$  is (1) such a function of  $a$  and the parameter  $n$  that the integral of it between the same limits is less than an assignable finite quantity, whatever value between  $A$  and  $B$  be given to  $b$ , and whatever value be given to  $n$ ; and (2) is such that when  $n$  tends toward infinity, the integral of  $\phi(a, n)$  from  $A$  to  $b$ , where  $b$  is greater than  $A$  and less than  $B$ , tends toward a constant finite value. This is called a *representative integral*, because it is equal to the function  $f_a$  multiplied by a constant.—**Representative knowledge**, knowledge of a thing by means of a mental image, but not as actually existing.—**Representative primogeniture**. See *primogeniture*.

II. *n.* 1. One who or that which represents another person or thing; that by which anything is represented or exhibited.

This doctrine supposes the perfections of God to be *representatives* to us of whatever we perceive in the creatures. Locke.

A statue of Rumour, whispering an idiot in the ear, who was the *representative* of credulity. Addison, *Freeholder*.

This breadth entitles him [Plato] to stand as the *representative* of philosophy.

Emerson, *Representative Men*, p. 44.

2. An agent, deputy, or substitute, who supplies the place of another or others, being invested with his or their authority: as, an attorney is the *representative* of his client or employer; specifically, a member of the British House of Commons, or, in the United States, of the lower branch of Congress (the House of Representatives) or of the corresponding branch of the legislature in some States.

Then let us drink the Stewartry,  
Keroughtree's laird, and a' that,  
Our *representatives* to be.

Burns, *Election Ballads*, I.

The tribunes of Rome, who were the *representatives* of the people, prevailed, it is well known, in almost every contest with the senate for life.

A. Hamilton, *Federalist*, No. 68.

There are four essentials to the excellence of a representative system:—That the *representatives* . . . shall be *representatives* rather than mere delegates.

Byrce, *Amer. Commonwealth*, I. 296.

3. In *law*: (a) One who occupies another's place and succeeds to his beneficial rights in such a way that he may also in some degree be charged with his liabilities. Thus, an heir or devisee, since, to the extent of the property to which he succeeds, he is liable for his ancestor's debts, is a *representative* of the ancestor; but the widow, who takes part of the estate as dower, without liability, is not deemed a *representative* of the deceased; nor is an officer or trustee who succeeds to the rights and powers of the office or trust a *representative* of his predecessor, for, though he comes under liability in respect of the office or trust as his predecessor did, he does not succeed to the liabilities which his predecessor had incurred. The executor or administrator is sometimes spoken of as the *representative* of the decedent, but is usually distinguished by being called the *personal representative*. (b) One who takes under the Statute of Descents or the Statute of Distributions, or under a will or trust deed, a share which by the primary intention would have gone to his parent had the parent survived to the time for taking. If a gift has vested in interest absolutely in the parent, then, upon the parent's death before it vests in possession, the child will take as successor in interest of the parent, but not as *representative* of the parent in this sense. But if the parent dies before acquiring any interest whatever, as where one of several heirs apparent dies before the ancestor, leaving a child or children, the other heirs take their respective shares as if the one had not died, and the child or children of the deceased take the share their deceased parent would have taken. In this case all who share are *representatives* of the ancestor in sense (a), and the child or children are also *representatives* of the deceased heir apparent in sense (b). See *representation*, 7.—House of Representatives, the lower branch of the United States Congress, consisting of members chosen biennially by the people. It consists at present (1906) of

386 members. In many of the separate States, also, the lower branch of the legislature is called the *House of Representatives*.—**Personal representative**. They follow the special prayers which succeed the Gospel of the Passion, and consist of sentences addressed by Christ to his people, reminding them of the great things he had done for them, in delivering them from Egypt, etc., and their ungrateful return for his goodness, as shown in the details of the passion and crucifixion. They are intermingled with the Trisagion ("Holy God . . .") in Greek and Latin, and succeeded by hymns and the bringing in of the pre-sanctified host in procession, after which the Mass of the Pre-sanctified is celebrated. The Reproaches are sometimes sung in Anglican churches before the Three Hours Service. Also called *Impropria*. = *Syn. 1. 2. The act or process of restoring parts of an organism that have been destroyed or removed.

Specifically—3. The process whereby new individuals are generated and the perpetuation of the species is insured; the process whereby new organisms are produced from those already existing: as, the reproduction of plants or animals.

(a) The reproduction of plants is effected either vegetatively or by means of spores or of seeds. Vegetative reproduction consists in the individualizing of some part of the parent organism. In low unicellular plants this is simply a process of fission, one cell dividing into two or more, much as in the formation of tissue, save that the new cells become independent. In higher plants this method obtains by the shooting and rooting of some fraction of the organism, as a branch, a joint of a rootstock, in *Begonia* even a part of a leaf; or through specially modified shoots or buds, as the gemmæ of some algae, mosses, etc., the bulbils of some mosses, ferns, the tiger-lily, etc., the corms, bulbs, and tubers of numerous annual plants. The cells engaged in this mode of reproduction are simply those of the ordinary tissues. Very many, but not all, plants propagate in this manner; but all are capable of reproduction in other methods included under the term *spore-reproduction*, which is reproduction most properly so called. This is accomplished through special reproductive cells, each of which is capable of developing into an individual plant. These are produced either independently, or through the conjunction of two separate cells by which their protoplasm coalesce. These may also in a less perfect sense be called reproductive cells. Reproduction through the union of two cells is sexual; through an independent cell, asexual. Sexual reproduction proceeds either by conjugation (that is, the union of two cells apparently just alike, which may be either common vegetative cells or specialized in form) or by fertilization, in which a smaller but more active sperm-cell or male cell impregnates a larger, less active germ-cell or female cell. In cryptogamous plants both methods are common, and the reproductive cells are termed *spores*, or when of the two sexes *gametes*, the male being distinguished as *antherozoids*, the female as *oötopheres*. In flowering plants spore-reproduction is always sexual, fertilization becoming pollination, the embryo-sac in the ovule affording the female cell and the pollen-grain the male cell. But the union of these cells produces, instead of a detachable spore, an embryo or plantlet, which, often accompanied by a store of nutriment, is inclosed within an integument, the whole forming a seed. The production of seeds instead of spores is the most fundamental distinction of phanerogams. Spore-reproduction is consummated by the germination of the spore or seed, which often takes place after a considerable interval. (b) Among the lowest animals, in which no sex is recognizable, reproduction takes place in various ways, which correspond to those above described for the lowest plants. (See *conjugation, fission, gemmation, and sporulation*.) Among sexed animals, reproduction results from the fecundation of an ovum by spermatozoa, with or without sexual copulation, and with many modifications of the details of the process. (See *genesis, 2*, and words there given.) Many animals are hermaphrodite, containing both sexes in one individual, and maturing the opposite sexual elements either simultaneously or successively: such are self-impregnating or reciprocally fecundating, as the case may be. Reproduction may be effected also by a detached part of an individual, constituting a separate person (see *generative person, under generative*). Sexual may alternate with asexual reproduction (see *parthenogenesis*); but in the vast majority of animals, invertebrate as well as vertebrate, permanent and perfect distinction of sex exists, in which cases reproduction always and only results from impregnation of the female by the male in a more or less direct or intimate act of copulation, and extends to but one generation of offspring. The organs or system of organs by which this is effected are known as the *reproductive organs* or *system*. Reproduction is always exactly synonymous with *generation* (def. 1); less precisely with *procreation* and *propagation* in their biological senses. See *sex*.

4. That which is produced or revived; that which is presented anew; a repetition; hence, also, a copy.

5. In *psychol.*, the act of repeating in consciousness a group of sensations which has already been presented in perception.

All *Reproduction* rests on the impossibility of the resuscitated impression reappearing alone.

*Harper's Mag., LXXVI. 331.*

**Reproductive cells**, in bot. See *reproduction, 3(a)*. — **Reproductive faculty**, in the psychology of Sir William Hamilton, the faculty of association of ideas, by virtue of which one suggests a definite other, but not including the faculty of apprehending an idea a second time. — **Reproductive function of order *n***. See *function*. — **Reproductive imagination**, the elementary faculty by virtue of which one idea calls up another, of which memory and imagination, as popularly understood, are special developments. See *imagination, 1*.

Philosophers have divided *imagination* into two — what they call the *reproductive* and the *productive*. By the former they mean imagination considered simply as re-exhibition, representing the objects presented by perception — that is, exhibiting them without addition or retrenchment, or any change in the relations which they reciprocally held when first made known to us through sense.  
*Sir W. Hamilton, Metaph., xxxiii.*

**Reproductive organs**. (a) In bot., the organs appropriated to the production of seeds or spores: in flowering plants, chiefly the stamens and pistils together with the accessory floral envelopes; in cryptogams, mainly the antheridia and archegonia. (b) In zool., those organs or parts of the body, collectively considered, whose function it is to produce and mature ova or spermatozoa or their equivalents, and effect the impregnation of the female by the male elements, or otherwise accomplish reproduction: the reproductive or generative system of any animal in either sex; the genitalia, in a broad sense. The fundamental reproductive organ of all sexed animals is an indifferent genital gland, differentiated in the male as a testis, in the female as an ovary (or their respective equivalents); its ulterior modifications are almost endless. These organs are sometimes detached from the main body of the individual (see *person, 8*, and *heterostyly*); they often represent both sexes in one individual: they are usually separated in two individuals of opposite sexes; they sometimes fall of functional activity in certain individuals of one sex (see *neuter, worker*). — **Reproductive system**, in bot., the sum of the reproductive or generative organs in plants and animals; the generative system; the sexual system of those plants and animals which have distinction of sex. The term is a very broad one, covering not only all parts immediately concerned in generation, but others indirectly conducing to the same end, as devices for effecting fecundation, for protecting or nourishing the product of conception, for cross-fertilization (as of plants by insects), for attracting opposite sexes (as of animals by odorous secretions), and the like. See *secondary sexual characters, under sexual*.

**Reptantia** (rep-tan'-shi-ə), *n. pl.* [NL., neut. pl. of *L. reptans* (t-s), ppr. of *reptare*, crawl: see *reptant*.] 1. In Illiger's classification (1811), the tenth order and also the thirtieth family of mammals, composed of the monotremes together with a certain tortoise (*Pamphractus*).—2. In *Mollusca*, those azygobranchiate gastropods which are adapted for creeping or crawling by the formation of the foot as a creeping-disk. All ordinary gastropods are *Reptantia*, the term being used in distinction from *Natantia* (which latter is a name of the *Heteropoda*). The *Reptantia* were divided into *Heliclamyda*, *Pneumonoclamyda*, and *Siphonoclamyda*.

The act of creeping or crawling on the belly, as a reptile does. *Owen*.—2. In *math.*, the motion of one plane figure around another, so as constantly to be tangent to the latter while preserving parallelism between different positions of its own lines; especially, such a motion of one figure round another precisely like it so that the longest diameter of one shall come into line with the shortest of the other. This motion was applied by John Bernoulli in 1706 to the rectification of curves. Let AB be a curve whose length is required; let this be reversed about its normal, giving the curve ABC, and let this be reversed about the line between its extremities, giving the spindle-shaped figure ABCD; let DEFG be a similar and equal figure turned through a right angle—then, if the first has a reptatory motion about the second, its center will describe a four-humped or quadrilobous figure OPQRSTU, with humps at P, R, T, V. Let this be placed in contact with a similar and equal figure so that a maximum and minimum diameter shall coincide, and receive a reptatory motion, then its center will describe an octolobous or eight-humped figure. By a similar process, this will describe a sixteen-humped figure, etc. Each of these figures will have double the periphery of the preceding, and they will rapidly approximate toward circles. Hence, by finding the diameters of each, we approximate to the length of the original curve.

**Reptatores** (rep-tā-tō-réz), *n. pl.* [NL., < *L. reptare*, pp. *reptatus*, creep, crawl: see *reptant*.] In *ornith.*, in Macgillivray's system of classification, an order of creeping birds, as creepers and nuthatches. [Not in use.]

**Reptilia** (rep-til'i-ə), *n. pl.* [NL., pl. of *L.L. reptile*, a reptile: see *reptile*.] In *zool.*: (a) In Linnaeus's system of classification (1766), the first order of the third class *Amphibia*, including turtles, lizards, and frogs. See *Amphibia*, 2 (a). [Disused.] (b) A class of cold-blooded oviparous or ovoviviparous vertebrate animals whose skin is covered with scales or scutes; the reptiles proper. There are two pairs or one pair of limbs, or none. The skull is monocondylar. The mandible articulates with the skull by a free or fixed quadrate bone. The heart has two auricles, generally not two completed ventricles; the ventricle gives rise to two arterial trunks, and the venous and arterial circulation are more or less mixed. Respiration is pulmonary, never branchial. No diaphragm is completed. There is a common cloaca of the digestive and urogenital systems, and usually two penes, sometimes one, seldom none. There are an amnion and an allantois. *Reptilia* thus defined were formerly associated with batrachians in a class *Amphibia*; but they are more nearly related to birds, and when brigaded therewith form their part of a superclass *Sauropsida*. The only living representatives of *Reptilia* are turtles or tortoises, crocodiles or alligators, lizards or saurians, and snakes or serpents, respectively constituting the four orders *Chelonia*, *Crocodylia*, *Lacertilia*, and *Ophidia*; and one living lizard, known as *Hatteria*, *Sphenodon*, or *Rhynchocephalus*, forming by itself an order *Rhynchocephalia*. In former times there were other orders of strange and huge reptiles, as the *Ichthyopterygia* or *Ichthyosaurus*, the *Ichthyosaurus*; *Anomodontia*; *Dinosaurus*, by some ranked as a subclass and divided into several orders; *Ornithosaurus* or *Pterosauria*, the pterodactyls; and *Plesiosaurus* or *Sauropterygia*, the plesiosaurs. See the technical names, and out of *Crocodylia*, *Ichthyosaurus*, *Ornithoscelida*, *Plesiosaurus*, *Plesiosauria*, *Pterodactyl*, and *Python*.

**republic** (rē-pub'lik), *n.* [Early mod. E. also *republick*, *republique* (= D. *republik* = G. *Dan. Sw. republik*; < OF. *republique*, *F. république* = Sp. *república* = Pg. *república* = It. *repubblica*,

*repubblica*, < *L. res publica*, prop. two words, but commonly written as one, *repubblica* (abl. *re publica*, *republicā*), the commonwealth, the state, < *res*, a thing, + *publica*, fem. of *publicus*, public: see *real* and *public*.] 1. The commonwealth; the state.

That by their deeds will make it known  
Whose dignity they do sustain;  
And life, state, glory, all they gain,  
Count the republic's, not their own.

B. Jonson, *Catiline*, II. (cho.).

2. A commonwealth; a government in which the executive power is vested in a person or persons chosen directly or indirectly by the body of citizens entitled to vote. It is distinguished from a monarchy on the one hand, and generally from a pure democracy on the other. In the latter case the mass of citizens meet and choose the executive, as is still the case in certain Swiss cantons. In a republic the executive is usually chosen indirectly, either by an electoral college as in the United States, or by the National Assembly as in France. Republics are oligarchic, as formerly Venice and Genoa, military, as ancient Rome, strongly centralized, as France, federal, as Switzerland, or, like the United States, may combine a strong central government with large individual powers for the several states in their particular affairs. See *democracy*.

We may define a republic to be . . . a government which derives all its powers directly or indirectly from the great body of the people, and is administered by persons holding their offices during pleasure, for a limited period, or during good behaviour.

Madison, *The Federalist*, No. 89.

The constitution and the government [of the United States] . . . rest, throughout, on the principle of the concurrent majority; and . . . it is, of course, a Republic, a constitutional democracy, in contradistinction to an absolute democracy; and . . . the theory which regards it as a government of the mere numerical majority rests on a gross and groundless misconception.

Calhoun, *Works*, I. 185.

**Cisalpine, Cispadane, Helvetic Republic**. See the adjectives.—**Grand Army of the Republic**, a secret society composed of veterans who served in the army or navy of the United States during the civil war. Its first "post" was organized at Decatur, Illinois, in 1866; its members are known as "comrades," and its annual meetings are "encampments." Abbreviated *G. A. R.*—**Republic of letters**, the collective body of literary and learned men.

S. hist., a political party which arose in Missouri in 1870–1 through a fusion of Liberal Republicans and Democrats, and as a national party nominated Horace Greeley as a candidate for the Presidency in 1872. Its candidate was endorsed by the Democratic convention, but was defeated, and the party soon disappeared.—**Republican calendar**. See *calendar*.—**Republican era**, the era adopted by the French soon after the proclamation of the republic, and used for a number of years. It was September 22d, 1792, "the first day of the Republic."—**Republican party**. (a) Any party which advocates a republic, either existing or desired: as, the Republican party of France, composed chiefly of Opportunists, Radicals, and Conservative Republicans; the Republican party in Italy in which Mazzini was a leader. (b) In U. S. hist.: (1) The usual name of the Democratic party (in full *Democratic-Republican party*) during the years following 1792–3: it replaced the name *Anti-Federal*, and was replaced by the name *Democratic*. See *Democratic party*, under *democratic*. (2) A party formed in 1854, having as its original purpose opposition to the extension of slavery into the Territories. It was composed of Free-soilers, of anti-slavery Whigs, and of some Democrats (who unitedly formed the group known as Anti-Nebraska men), and was joined by the Abolitionists, and eventually by many Know-nothings. During the period of the civil war many war Democrats acted with it. It first nominated a candidate for President in 1856. It controlled the executive from 1861 to 1865 and in 1869, 1897, 1901, and 1905 (Presidents Lincoln, Johnson, Grant, Hayes, Garfield, Arthur, Harrison, McKinley, and Roosevelt), and both houses of Congress from 1861 to 1875 and again in 1869 and 1896–7. It favors generally a broad construction of the Constitution, liberal expenditures, extension of the powers of the national government, and a high protective tariff. Among the measures with which it has been identified in whole or in part are the suppression of the rebellion, the abolition of slavery, reconstruction, and the resumption of specie payments.—**Republican swallow**, the cliff- or cave-swallow. See def. 4, and cut under *cave-swallow*.

S. hist.*, an extreme or radical Republican; one who after the civil war advocated strong measures in dealing with persons in the States lately in rebellion. The term arose before the war; the epithet "black" was used intensively, in offensive allusion to the alleged friendliness of the party toward the negro.—**National Republican**, in *U. S. hist.*, a name assumed during the administration of J. Q. Adams (1825–9) by that wing of the Democratic party which sympathized with him and his measures, as distinguished from the followers of Jackson. The National Republicans in a few years took the name of Whigs. This fund was first accumulated for the resumption of specie payments, and at that date (Jan. 1, 1879) amounted to over \$114,000,000. By the provisions of the act of July 12, 1882, it was practically fixed at \$100,000,000. In April, 1883, it first fell below this sum as a result of the policy of the treasury (under the "parity" clause of the act of July 14, 1890) in paying the treasury notes of 1890, on demand, in gold; and by January, 1894, fell to \$65,450,000. To replenish the fund the government sold bonds—\$50,000,000 of 5 per cent. bonds in January, 1894; \$50,000,000 of 5 per cent. bonds in November, 1894; about \$32,000,000 of 4 per cent. bonds in February, 1895; and \$100,000,000 of 4 per cent. bonds in January, 1896.—In reserve, in store; in keeping for other or future use.—Reserve air. *5. In law: (a) The place where a man's habitation is fixed without any present intention of removing it therefrom; domicile. (b) An established abode, fixed for a considerable time, whether with or without a present intention of ultimate removal. See *quadratic*.—**Trigonal residue**, a number which, added to a multiple of another num-

It. *resina*, < *L. resina*, prob. < Gr. *ῥηῖν*, resin (of the pine).] 1. (a) A hardened secretion found in many species of plants, or a substance produced by exposure of the secretion to the air. It is allied to and probably derived from a volatile oil. The typical resins are oxidized hydrocarbons, amorphous, brittle, having a vitreous fracture, insoluble in water, and freely soluble in alcohol, ether, and volatile oils. They unite with alkalis to form soaps. They melt at a low heat, are non-volatile, and burn quickly with a smoky flame. The hardest resins are fossilized like amber and copal, but they show all gradations of hardness through oleoresins and balsams to essential oils. The *hard resins* are nearly inodorous, and contain little or no volatile oil; the *soft resins* owe their softness to the volatile oil associated with them. The common resin of commerce exudes in a semi-fluid state from several species of pine (in the United States, chiefly the long-leaved pine). From this the oil of turpentine is separated by distillation. Resins are largely used in the preparation of varnishes, and several are used in medicine. See *gum*. Pg. *resistencia* = It. *resistenza*, < ML. *\*resistentia*, < *L. resisten(t)s*, ppr. of *resistere*, resist: see *resist*, *resistant*.] 1. The act of resisting; opposition; antagonism.

Resistance is *passive*, as that of a fixed body which interrupts the passage of a moving body; or *active*, as in the exertion of force to stop, repel, or defeat progress or design. See *resistances* durst they mak. Battle of Harlaw (Child's Ballads, VII. 183).

He'll not swagger with a Barbary hen, if her feathers turn back in any show of *resistance*. Shak., 2 Hen. IV., II. 4. 100.

2. The force exerted by a fluid or other medium to retard the motion of a body through it; more generally, any force which always acts in a direction opposite to the residual velocity, or to any component of it: as, *resistance* to shearing. In a phrase like this, *resistance* may be defined as a stress produced by a strain, and tending to restoration of figure. But the resistance is not necessarily elastic—that is, it may cease, and as resistance does cease, when the velocity vanishes. In the older dynamical treatises, resistance is always considered as a function of the velocity, except in the case of friction, which does not vary with the velocity, or at least not much. In modern hydrodynamics the viscosity is taken into account, and produces a kind of resistance partly proportional to the velocity and partly to the acceleration. The theory of resistance still remains imperfect.

Energy, which is force acting, does work in overcoming *Resistance*, which is force acted on and reacting. G. H. Leves, Probs. of Life and Mind, II. v. § 5.

3. In *elect.*, that property of a conductor in virtue of which the passage of a current through it is accompanied by a dissipation of energy; the transformation of electric energy into heat. It is one of the two elements upon which the strength of an electric current depends when the flow is steady; the other is electromotive force, and the relation between them is generally expressed by the equation  $C = E/R$ , which is Ohm's law. *Resistance* may therefore be defined as the ratio of the electromotive force to the current strength ( $R = E/C$ ), the flow being assumed to be steady. For simple periodic alternate currents, the resistance increases as the rapidity of alternation increases, and it also depends on the form of the conductor. Resistance to such currents is sometimes called *impedance* and also *virtual resistance*, that for steady flow being named *ohmic resistance*. In general, resistance is proportional to the length of the conductor and inversely proportional to its cross-section. It also varies with the temperature of the conductor, the nature of the material of which it is composed, the stress to which it is subjected, and in some instances with other physical conditions, as in the case of selenium, the resistance of which diminishes as the intensity of the

light to which it is exposed increases. It is the reciprocal of conductivity. The unit of resistance is the ohm (which see). The designation *resistance* is also applied to coils of wire or other material devices which are introduced into electric circuits on account of the resistance which they offer to the passage of the current. The resistance of a conductor may be measured by Wheatstone's bridge. This is a device for the accurate comparison of electric resistances, invented by Christie and brought into notice by Wheatstone. It consists essentially of a complex circuit of six conductors, arranged as shown in the cut. A current from the battery B enters at the junction of a and c, and, after dividing into parts depending on the relative resistances of the branches a, b, c, and d, returns to the battery through the junction of b and d. G is a galvanometer joined to the junctions a b and c d. When the relative resistances are such that  $a : b :: c : d$ , no current will flow through the galvanometer. If a and b are comparable and adjustable resistances, it is only necessary to establish this condition in order to know the ratio of c to d. Many modifications of the bridge have been devised.—**Center of resistance.** See *center*.—**Conduction resistance,** the resistance offered by a conductor to an electric current.—**Contact resistance.** See *contact*.—**Curve of elastic resistance.** See *curve*.—**Living resistance,** the work required to produce a sudden strain of a body, especially a sudden elongation of a solid.—**Magnetic resistance,** the reciprocal of magnetic conductivity or permeability. The magnetic flux, or total number of magnetic lines of force passing through a cross-section of any magnetic circuit, may be given in an expression analogous to that giving the strength of an electric current in terms of the electromotive force and resistance. The denominator of the fraction represents the magnetic resistance, sometimes called *magnetic reluctance*.—**Passive resistance,** a friction or similar force opposing the motion of a machine.—**Principle of least resistance,** the principle that when a structure is in equilibrium the passive forces, or stresses occasioned by minute strains, are the least that are capable of balancing the active forces, or those which are independent of the strains.—**Solid of least resistance,** in *mech.*, the solid whose figure is such that in its motion through a fluid it sustains less resistance than any other having the same length and base, or, on the other hand, being stationary in a current of fluid, offers the least interruption to the progress of that fluid. In the former case it has been considered the best form for the stem of a ship; in the latter, the proper form for the pier of a bridge. The problem of finding the solid of least resistance was first proposed and solved by Newton, but only for hypothetical conditions extremely remote from those of nature.—**Specific resistance,** the resistance offered by a conductor of any given material the length of which is one centimeter and the cross-section one square centimeter.—**Transition resistance,** the resistance to an electric current in electrolysis caused by the presence of the ions at the electrodes.—**Syn.** 1. (b) The prolongation or increase of sound by the sympathetic vibration of other bodies than that by which it is originally produced. It is carefully utilized in musical instruments, as by means of the sounding-board of a pianoforte, the body of a violin, or the tube of a horn. In many wind-instruments, like the flute, and the flue-pipes of an organ, the pitch of the tone is almost wholly determined by the shape and size of the resonant cavity or tube. The act of breathing again or resuming life.

Till the day  
Appear of respiration to the just,  
And vengeance to the wicked.

Milton, P. L., xii. 540.

2. The inspiration and expiration of air.—3. That function by which there takes place an absorption of oxygen from the surrounding medium into the blood with a corresponding excretion of carbon dioxide. This is accomplished in the higher animal forms chiefly by the lungs and skin; the gills or branchiae of aquatic animals and the tracheae of insects perform the same function. In unicellular organisms these changes take place in the protoplasm of the cell itself. The number of respirations in the human adult is from 16 to 24 per minute. About 500 centimeters or one sixth of the volume of the air in the lungs is changed at each respiration, giving a daily income of about 744 grams of oxygen and an expenditure of 900 grams of carbon dioxide. Inspiration is slightly shorter than expiration.

Ev'ry breath, by respiration strong  
Forc'd downward. *Couper, Task*, iv. 348.

4. In *physiological bot.*, a process consisting in the absorption by plants of oxygen from the air, the oxidation of assimilated products, and the release of carbon dioxide and watery vapor. It is the opposite of *assimilation*, in which carbon dioxide (carbonic acid) is absorbed and oxygen given off—contrasted also as being the waste process in the plant economy, a part of the potential energy of a higher compound being converted into kinetic energy, supporting the activities of the plant, the resulting compound of lower potential being excreted. Respiration takes place in all active cells both by day and by night; assimilation only by daylight (then overshadowing the other process) and in cells containing chlorophyll.

5. The respiratory murmur.—6. A breathing-spell; an interval.

Some meet respiration of a more full trial and enquiry into each others' condition.

Bp. Hall, Cases of Conscience, iv. 6.

**Abdominal respiration.** See *abdominal*.—**Amphoric respiration**, respiratory murmur with musical intonation, such as might be produced by blowing across the mouth of a bottle. It occurs in some cases of pneumothorax and with some phthisical cavities.—**Artificial respiration**, respiration induced by artificial means. It is required in cases of drowning, the excessive inhalation of chlorine or of noxious gases, etc. In the case of a person apparently drowned, or in an asphyxiated condition, the following treatment has been recommended. After clearing the mouth and throat, the patient should be laid on his back on a plane inclined a little from the feet upward; the shoulders gently raised by a firm cushion placed under them; the tongue brought forward so as to project from the side of the mouth, and kept in that position by an elastic band or string tied under the chin. Remove all tight clothing from neck and chest. The arms should then be grasped just above the elbows, raised till they nearly meet above the head, and kept stretched upward for two seconds: this action imitates inspiration. The arms are then turned down and firmly pressed for two seconds against the sides of the chest, thus imitating a deep expiration. These two sets of movements should be perseveringly repeated at the rate of fifteen times in a minute. As soon as a spontaneous effort to breathe is perceived, cease the movements and induce circulation and warmth.—**Branchial respiration.** See *branchial*.—**Branchial**

**respiration**, respiration such as is heard immediately over bronchus, or over the trachea. The inspiratory sound is high in pitch and tubular; the expiratory sound is higher, tubular, and prolonged. It is heard in disease over consolidated lungs. Also called *tubular respiration*.—**Bronchocavernous respiration**, respiration intermediate in character between bronchial and cavernous respiration.—**Bronchovesicular respiration**, respiration intermediate in character between bronchial and vesicular respiration.—**Cavernous respiration.** See *cavernous*.—**Center of respiration**, the nervous center which regulates respiration. It is automatic in action, but is guided by incoming influences from the vagus, the skin, and elsewhere. The main center is limited in extent, and situated in the floor of the fourth ventricle, near the point of the calamus.—**Cerebral respiration**, shallow, quick, irregular, more or less sighing respiration, sometimes resulting from cerebral disease in children.—**Cheyne-Stokes respiration**, a rhythmic form of respiration described by Cheyne in 1818 and by Stokes in 1846. It consists of a series of cycles in every one of which the respirations pass gradually from feeble and shallow to forcible and deep, and then back to feeble again. A pause follows, and then the next cycle begins with a feeble inspiration. This symptom has been found associated with cardiac and brain lesions.—**Cogged or cog-wheel respiration.** Same as *interrupted respiration*.—**Costal respiration**, respiration in which the costal movements predominate over the diaphragmatic.—**Cutaneous respiration**, gaseous absorption and excretion by the skin.—**Diaphragmatic respiration.** Same as *abdominal respiration* (which see, under *abdominal*).—**Divided respiration**, respiration in which inspiration is separated from expiration by a well-marked interval.—**Facial respiration**, respiratory movements of the face, as of the ale naal.—**Harsh respiration.** Same as *rude respiration*.—**Indeterminate respiration.** Same as *bronchovesicular respiration*, especially its more vesicular grades.—**Interrupted respiration**, respiration in which the inspiratory, sometimes the expiratory, sound is broken into two or more parts. Also called *jerked*, *wavy*, and *cogged or cog-wheel respiration*.—**Jerked respiration.** Same as *interrupted respiration*.—**Laryngeal respiration**, laryngeal respiratory movements.—**Metamorphosing respiration**, respiration in which the first part of the inspiratory sound is tubular and the last part cavernous.—**Organs of respiration**, any parts of the body by means of which constituents of the blood are interchanged with those of air or water. In the higher vertebrates, all of which are air-breathers, such organs are internal, and of complex lobulated structure, called *lungs*. (See *lung*.) In lower vertebrates and many invertebrates respiration is effected by breathing water, and such organs are usually called *gills* or *branchiae*. Most invertebrates, however (as nearly all the immense class of insects), breathe air by various contrivances for its admission to the body, generally of tubular or laminated structure, which may open by pores or spiracles on almost any part of the body. The organs of mollusks are extremely variable in form and position; they are commonly called *branchiae* or *gills*, technically *ctenidia*. Some gastropods, called *pulmonate*, are air-breathers. Arachnids are distinguished as *pulmonate* and *tracheate*, according to the laminar (or ascular) or the simply tubular character of their organs of respiration. The character of the lungs as objects of the alimentary canal is somewhat peculiar to the higher vertebrates—being represented in the lower, as fishes, only by an air-bladder, if at all; and the various organs of respiration of lower animals are only analogous or functionally representative, not homologous (morphologically representative, of such lungs. (See *pneogaster*.) In birds the organs are distributed in most parts of the body, even in the interior of bones. (See *pneumatocyst*.) In embryos the allantois is an organ of respiration, as well as of digestion and circulation. See *cuta* under *Branchiostoma*, *gill*, and *Mya*.—**Puerile respiration.** See *puerile*.—**Rough respiration.** Same as *rude respiration*.—**Rude respiration**, a form of bronchovesicular respiration, the sounds being harsh.—**Supplementary respiration**, respiration with increased vesicular murmur, as heard over normal parts of the lungs when some other part of them is incapacitated, as from pneumonia or pleurisy.—**Thoracic respiration.** Same as *costal respiration*.—**Tubular respiration.** Same as *branchial respiration*.—**Vesiculocavernous respiration**, respiration intermediate in character between vesicular and cavernous respiration.

It is mostly used to exclude the passage into the lungs of cold air, smoke, dust, and other noxious substances, especially by persons having delicate chests, by firemen, cutlers, grinders, and the like, and by divers in operations under water. Respirators for persons with weak lungs have several piles of fine gauze made of highly heat-conducting metal, which warms the air as it passes through. See *aerophore*.

**respiratorium** (res'pī-rā-tō-ri-um), *n.*; pl. *respiratoria* (-ā). [*NL.*, neut. of *respiratorius*, respiratory: see *respiratory*.] In *entom.*, one of the laminiform gill-like organs or branchiae found on the larvae of certain aquatic insects, and used to draw air from the water. Conf. of Faith*, xxxii. 2. F. Clarke*, Orthodoxy, its Truths and Errors, xii. § 6. (3) The doctrine of Swedenborg, that every man is possessed of two bodies, a natural and a spiritual, the latter within the former, and that at death the natural body is laid aside and the spiritual body rises at once from the death of the natural, resurrection thus taking place for every one immediately upon and simultaneously with death. fine network, < *L. rete*, a net: see *rete*.] The innermost and chiefly nervous coat of the posterior part of the eyeball, between the choroid coat and the vitreous humor. It extends from the entrance into the eyeball of the optic nerve toward the crystalline lens, terminating in the ora serrata. A modified division of the retinal structure is, however, continued forward as the pars ciliaris retinae. The retina consists of a delicate and complex expansion and modification of the optic nerve, supported by a network of connective tissue. It may be divided into ten layers: (1) Internally, next the hyaloid membrane of the vitreous humor, the internal limiting membrane, formed of the expanded bases of the fibers of Müller; (2) the fibers of the optic nerve; (3) layer of ganglion-cells; (4) internal molecular or granular layer; (5) inner nuclear layer; (6) external molecular or granular layer; (7) external nuclear layer; (8) external limiting membrane, which is connected with the ends of Müller's fibers; (9) layer of rods and cones, or bacillary layer; (10) pigmentary layer. In the center of the back part of the retina, near the line of the optic axis, is the macula lutea, the most sensitive part of the retina; and in the center of the macula is a depression, the fovea centralis, in which the rods are absent. The color of the macula is due to a yellow pigment. About one tenth of an inch internally to the fovea is the point of entrance of the optic nerve with its central artery; the retina is incomplete at this point, and constitutes the "blind spot." The nerve-fibers have been estimated to number 400,000 broad and as many narrow fibers, and for each fiber there are 7 cones, 100 rods, and 7 pigment-cells. The retina serves the purpose of vision in being the organ through or by means of which vibrations of luminiferous ether excite the optic nerve to its appropriate activity. **Retribution theory**, the theory that the condition of the soul after death depends upon a judicial award of rewards and punishments based upon the conduct pursued and the character developed in this life. It is distinguished from the theory that the future life is (a) simply a continuance of the present (continuance theory); (b) a life of gradual development by means of discipline (purgatory), or future redemptive influences (future probation).

On the whole, however, in the religions of the lower range of culture, unless where they may have been affected by contact with higher religions, the destiny of the soul after death seems comparatively seldom to turn on a judicial system of reward and punishment. Such difference as they make between the future conditions of different classes of souls seems often to belong to a remarkable intermediate doctrine, standing between the earlier continuance theory and the *retribution theory*.

It is generally attributed by the church to the apostle John, and the date of its composition is often put near the end of the first century. There is a wide difference of opinion as to the interpretation and significance of this book. The schools of interpretation are of three principal kinds. The first school, that of the preterists, embraces those who hold that the whole or by far the greater part of the prophecy of this book has been fulfilled; the second is that of the historical interpreters, who hold that the prophecy embraces the whole history of the church and its foes, from the first century to the end of the world; the third view is that of the futurists, who maintain that the prophecy, with perhaps the exception of the first three chapters, relates entirely to events which are to take place at or near to the second coming of the Lord. =**Syn.** 1. *Revenge, Vengeance, Retribution, Retaliation, and Reprisal* agree in expressing the visiting of evil upon others in return for their misdeeds. *Revenge* is the carrying out of a bitter desire to injure an enemy for a wrong done to one's self or to those who seem a part of one's self, and is a purely personal feeling. It generally has reference to one's equals or superiors, and the malignant feeling is all the more bitter when it cannot be gratified. *Vengeance* has an earlier and a later use. In its earlier use it may arise from no personal feeling, but may be visited upon a person for another's wrong as well as for his own. In the Scripture it means retribution with indignation, as in Rom. xii. 19: "*Vengeance* is mine; I will repay, saith the Lord," where it is a reservation for Jehovah of the offices of distributive and retributive justice. In its later use it involves the idea of wrathful retribution, whether just, unjust, or excessive; it is often a furious *revenge*: hence there is a general tendency to turn to other words to express just retribution, especially as an act of God. *Retribution* bears more in mind the amount of the wrong done, viewing it as a sort of loan whose equivalent is in some way paid back. Any evil result befalling the perpetrator of a bad deed in consequence of that deed is said to be a *retribution*, whether occurring by human intention or not; personal agency is not prominent in the idea of *retribution*. *Retaliation* combines the notion of equivalent return, which is found in *retribution*, with a distinctly personal agency and intention; sometimes, unlike the preceding words, it has a light sense for good-humored teasing or banter. *Reprisal* is an act of retaliation in war, its essential point being the capture of something in return or as indemnification for pecuniary damage from the other side. The word has also a looser figurative meaning, amounting essentially to retaliation of any sort. See *avenge, requital*, and the definition of *retribution*.

The act of revolving or turning completely round, so as to bring every point of the turning body back to its first position; a complete rotation through 360°. Where the distinction is of importance, this is called a *rotation*.

She was probably the very last person in town who still kept the time-honored spinning-wheel in constant *revolution*.  
*Hawthorne, Seven Gables*, v.

2. The act of moving completely around a circular or oval course, independently of any rotation. In a revolution without rotation, every part of the body moves by an equal amount, while in rotation the motions of the different parts are proportional to their distances from the axis. But revolutions and rotations may be combined. Thus, the planets perform *revolutions* round the sun, and at the same time *rotations* about their own axes. The moon performs a *rotation* on its axis in precisely the same time in which it performs a *revolution* round the earth, to which it consequently always turns the same side.

*Ruskin, Seven Lamps of Architecture, Memory, § 3.*  
Hence—4. A recurrent period or moment in time. [Rare.]

Thither by harpy-footed furies haled,  
At certain revolutions all the damn'd  
Are brought. *Milton, P. L., II. 507.*

5. A total change of circumstances; a complete alteration in character, system, or conditions.

*Macaulay, Moore's Byron.*  
Specifically—6. A radical change in social or governmental conditions; the overthrow of an established political system, generally accompanied by far-reaching social changes. The term *Revolution*, in English history, is applied distinctively to the convulsion by which James II. was driven from the throne in 1688. In American history it is applied to the war of independence. See below. [In this sense the word is sometimes used adjectively.]

The elections . . . generally fell upon men of revolution principles. *Smollett, Hist. Eng., I. 6.*

The revolution, as it is called, produced no other changes than those which were necessarily caused by the declaration of independence. *Calhoun, Works, I. 189.*

9. The winding or turning of a spiral about its axis, as a spiral of a shell about the columella; one of the coils or whorls thus produced; a volution; a turn.—*American Revolution*, the series of movements by which the thirteen American colonies of Great Britain revolted against the mother country, and asserted and maintained their independence. Hostilities began in 1775, independence was declared in 1776, and the help of France was formally secured in 1778. The war was practically ended by the surrender of the chief British army at Yorktown in 1781, and the independence of the United States was recognized by treaty of peace in 1783.—*Anomalous revolution*. See *anomalistic*.—*English Revolution*, the movements by which James II. was forced to leave England, and a purer constitutional government was secured through the aid of William of Orange, who landed with an Anglo-Dutch army in November, 1688. In 1689 William and Mary were proclaimed constitutional sovereigns, and Parliament passed the Bill of Rights.—*French Revolution*, the series of movements which brought about the downfall of the old absolute monarchy in France, the establishment of the republic, and the abolition of many abuses. The States General assembled in May, 1789, and the Third Estate at once took the lead. The Bastille was stormed by the people, and in the same year the Constituent Assembly overthrew feudal privileges and transferred ecclesiastical property to the state. Abolition of titles and of right of primogeniture, and other reforms, were effected in 1790. The next year a constitution was adopted and the Constituent was succeeded by the Legislative Assembly. In 1792 a coalition of nations was formed against France, the royal family was imprisoned, and in September the Convention replaced the Legislative Assembly and proclaimed the republic. Louis XVI. was executed in 1793, and the Reign of Terror followed in 1793-4; royalist risings were suppressed, and the foreign wars successfully prosecuted. The revolutionary period may be regarded as ending with the establishment of the Directory in 1795, or as extending to the founding of the Consulate in 1799, or even later. Other French revolutions in 1830, 1848, and 1870 resulted respectively in the overthrow of the Bourbon monarchy of the Restoration, of the monarchy of Louis Philippe, and of the Second Empire.—*Pole of revolution*. See *pole*.—*Revolution-indicator*. Same as *operameter*.—*Solid of revolution*, a solid containing all the points traversed by a plane figure in making a revolution round an axis in its plane, and containing no others. The *ellipsoid*, *paraboloid*, *hyperboloid*, etc., of revolution are examples.—*Syn.* 6. See *insurrection*.

ly—(a) A revolving firearm, especially a pistol, having a revolving barrel provided with a number of bores (as in earlier styles of the weapon), or (as in modern forms) a single barrel with a revolving cylinder at its base, provided with a number of chambers. When the barrel or cylinder revolves on its longitudinal axis, the several bores or chambers are brought in succession into relation with firing-mechanism for successive and rapid firing. In the modern forms of the arm the chambers of the cylinder are, by such revolution, brought successively into line with the bore in the barrel, which is also the firing position. In this position each chamber respectively forms a continuation of the bore in the barrel. Six is the common number of chambers. The most vital distinction between early and modern revolving firearms is that the barrels of the former were directly revolved by the hand; while in the latter the revolving-mechanism is connected with the firing-mechanism, the cocking of which automatically revolves the cylinder. Metal cartridges with conical bullets are used in all modern revolvers, the loading being done at the breech. Some are self-cocking—that is, are cocked by pulling the trigger which also discharges them. Some, by peculiar mechanism (though, for general use, they may be cocked in the ordinary way for taking deliberate aim), are by a quick adjustment changed into self-cocking pistols for more rapid firing in emergencies where accurate aim is of subordinate importance. Colonel Colt of the United States was the first to produce a really serviceable and valuable revolving arm, though the principle was known in the earlier part of the sixteenth century. (b) A revolving cannon.—3. A revolving horse-rake.

The heat is supplied by a Siemens regenerative gas-furnace, or by a coal-furnace, and the hot flame circulates longitudinally through the cylinder into a smoke-stack or chimney. The charging is done through a hole in the side of the cylinder, and the crude soda, rolled into balls by the motion of the cylinder, is discharged through the same opening.—**Revolving pistol.** Same as *revolver*.—**Revolving press.** See *press*.—**Revolving storm,** a cyclone.

The function of the rhabdites seems related to the tactile sense. They vary in size and form, and also in their local or general dispersion on the body of the worm. They are produced in the ordinary epidermic cells, or in special formative cells beneath the integument, whence they work their way to the surface. **Rhabdocœla** (rab-dō-sē'lā), *n. pl.* [NL., *< Gr. ῥάβδος, a rod, + κοίλος, hollow*.] A prime division of turbellarian worms,

forming a suborder of *Turbellaria*, contrasted with *Dendrocoela* (which see), containing small forms whose intestine, when present, is straight and simple. The body is cylindric (as compared with other flatworms), but more or less flattened; the sexual organs are usually hermaphrodite; there is no anus (see *Apocœta*), but a mouth, the position of which varies extremely in different genera, and usually a protrusile pharynx or buccal proboscis. In most forms the alimentary canal is distinct; in others (see *Acœla*) it is not fairly differentiated from the general digestive parenchyma. There are numerous forms of this group, mostly inhabiting fresh water, though some are marine. They live on the juices of small worms, crustaceans, and insects, which they suck after enveloping their prey in a sort of mucus secreted by the skin and containing rhabdites. (See *rhabdite*, 2.) The group is divided, mainly upon the character of the intestine, into three sections: (1) *Acœla*, without differentiated intestine, represented by the family *Convolutidae*; (2) *Rhabdocœla* proper, with definite intestinal tract, a nervous system and excretory organs present, compact male and female generative glands, complicated pharynx, and generally no otoliths—embracing numerous forms of several different families, both of fresh and salt water; (3) *Alloacœla*, resembling (2), but with otoliths, represented by one family, *Monotidae*. Another division, based mainly upon the position or other character of the mouth, is directly into a number of families, as *Convolutidae, Opisthomidae, Derostomidae, Mesostomidae, Prostomidae, and Microstomidae*. Also called *Rhabdocœlida*.

**rhagon** (*rag'-on*), *n.* [NL., < Gr. *páyē* (*pay-*), a grape.] A type of sponge-structure resulting from the modification of a primitive form, as an olynthus, by the outgrowth of the endoderm into a number of approximately spherical chambers communicating with the exterior by a prosopyle and with the paragastric cavity by an apopyle (see *prosopyle*), with conversion of the flagellated into pavement epithelium except in the chambers. The rhagon occurs as a stage in the early development of some sponges, and others exhibit it in the adult state. The structure is named from the grape-like form of the spherical chambers. The term is correlated with *ascon*, *leucon*, and *sycon*. Also called *dysycon*.

This may be termed the apodal or racemose type of the *Rhagon* system, since the chambers at the ends of the apophysis radiating from the excurrent canal look like grapes on a bunch. *W. J. Sollas*, *Encyc. Brit.*, XXII. 415.

It is unlike the rest of its cohort *Celastrales* in its valvate calyx-lobes, and resembles the related *Amelidaceae*, or grape family, in its superior ovary and the position of its stamens opposite the petals; it is distinguished by its habit, strongly perigynous stamens, concave petals which are not caducous, larger and valvate sepals, and fruit not a berry. It includes about 475 species, classed in 5 tribes and 42 genera, widely diffused through warm countries. They are commonly erect trees or shrubs, often thorny, bearing undivided alternate or opposite stipulate leaves, which are often coriaceous and three- to five-nerved. The small flowers are greenish or yellow, commonly in axillary cymes, which are followed by three-celled capsules or drupes, sometimes edible, sometimes hard and indehiscent. It is often called the *buckthorn family*, from the common name of *Rhamnus*, the type genus. See cut under *Rhamnus*.

P. de Candolle, 1825), < *Rhamnus* + *-ae*.] The principal tribe of the order *Rhamnaceae*, characterized by a dry or drupaceous fruit containing three stones which are indehiscent or two-valved. Although this name was originally employed for the order, it is better to restrict it to the tribe, and adopt the later form *Rhamnaceae* of Lindley for the ordinal term, as is very generally done. See *Rhamnus*, *Ceanothus*, *Sageretia*, and *Pomaderris* for the chief among its 21 genera.

**Rhamnus** (*ram'nus*), *n.* [NL. (Tournefort, 1700), < L. *rhamnos*, < Gr. *ῥάμνος*, the buckthorn, Christ's-thorn.] A genus of polypetalous shrubs and trees, including the buckthorn, type of the order *Rhamnaceae* and of the tribe *Rhamneae*. It is characterized by a thin disk sheathing the bell-shaped calyx-tube and bearing the four or five stamens on its margin; by a free ovary often immersed within the disk; and by its fruit, an oblong or spherical drupe, surrounded at its base by the small calyx-tube, and containing two, three, or four hard one-seeded stones. There are about 86 species, natives of warm and temperate regions, frequent in Europe, Asia, and America, rare in the tropics. They bear alternate petioled and feather-veined leaves, which are either entire or toothed, deciduous or evergreen, and are furnished with small deciduous stipules. The flowers are in axillary racemes or cymes, and are commonly dioecious in the typical section, but not so in the principal American species (the genus *Frangula* of Brongniart), which also differ in their unfurrowed seeds and flat fleshy seed-leaves. A general name for the species is *buckthorn*, the common buckthorn being *R. cathartica* of the northern Old World, planted and sparingly nat-

uralized in the United States. It is used as a hedge-plant. Its bark is medicinal, like that of *R. Frangula*; its black berries afford a now nearly disused cathartic, and with

Branch of Common Buckthorn (*Rhamnus cathartica*) with Fruit. *a*, female flower; *b*, male flower; *c*, leaf, showing the venation.

those of some other species yield by treatment the pigment known as *sep-green*. *R. Frangula*, of the same nativity, called *black* or *berry-bearing alder*, *alder-buckthorn*, and (*black*) *dogwood*, affords one of the very best gunpowder-charcoals, while its bark is an official cathartic. (See *frangula*, *frangulin*.) The fruit of *R. infectiorius* and other species forms the French, Turkey, or Persian berries of the dyers. (See under *Persian*.) In China the bark of *R. tinctorius* (*R. chlorophorus*) and *R. Davuricus* (*R. utilis*) affords the famous green indigo, or *lokao*, there used to dye silks, also introduced at Lyons. (For other Old World species, see *alaternus* and *lotus-tree*, 3.) *R. Caroliniana* of the southern United States is a shrub or small tree, bearing a sweet and agreeable fruit. The berries of *R. croceus* of California are much eaten by the Indians. *R. Californicus*, the California coffee-tree, yields an unimportant coffee-substitute. *R. Purshianus* of the western coast yields the cascara sagrada bark (see under *bark*), sometimes called *chittam-bark*, whence probably, in view of the hard fine wood, the name *skittim-wood*. See *seaberry*, 2, and *redwood*, 2.

There were various methods of practicing this *rhapsodomancy*. Sometimes they wrote several verses or sentences of a poet on so many pieces of wood, paper, or the like, shook them together in an urn, and drew out one.

Sometimes they cast dice on a table on which verses were written, and that on which the die lodged contained the prediction. A third manner was by opening a book, and pitching on some verse at first sight. This method they particularly called the *Sortes Frænestine*, and afterwards, according to the poet thus made use of, *Sortes Homerice*, *Sortes Virgiliane*, &c. Rees, Cyclopædia.

The art of discourse; the art of using language so as to influence others. Rhetoric is that art which consists in a systematic use of the technical means of influencing the minds, imaginations, emotions, and actions of others by the use of language. Primarily, it is the art of oratory, with inclusion of both composition and delivery; secondarily, it also includes written composition and recitation. It is also used in narrower senses, so as to present the idea of composition alone, or the idea of oratorical delivery (elocution) alone. Etymologically, rhetoric is the art, or rather the technique (*τέχνη*), somewhat different in scope from our art, of the rhetor—that is, either the popular (political) orator or the judicial and professional rhetor. Accordingly, ancient writers regarded it mainly as the art of persuasion, and something of this view almost always attaches to the word even in modern use, so that it appears to be more or less inappropriate to use *rhetoric* of mere scientific, didactic, or expository composition. The element of persuasion, or at least of influence of thought, belongs, however, to such composition also in so far as accurate and well-arranged statement of views leads to their adoption or rejection, the very object of instruction involving this. On the other hand, poetry and epideictic oratory chiefly address the imagination and emotions, while the most important branches of oratory (deliberative and judicial oratory) appeal especially to the mind and emotions with a view to influencing immediate action. The theory or science underlying the art of rhetoric, and sometimes called by the same name, is essentially a creation of the ancient Greeks. Rhetoric was cultivated on its more practical side first of all by the earlier rhetors (so-called "sophists") and orators (Empedocles—considered the inventor of rhetoric—Gorgias, Isocrates, etc.), many of whom wrote practical treatises (*ῥήματα*) on the art. The philosophers, on the other hand, among them Aristotle, treated the subject from the theoretical side. The system of rhetoric which finally became established, and has never been superseded, though largely mutilated and misunderstood in medieval and modern times, is that founded upon the system of the Stoic philosophers by the practical rhetorician Hermagoras (about 60 B. C.). Its most important extant representatives are Hermogenes (about A. D. 165) among the Greeks, and Quintilian (about A. D. 95) among the Latins. This theory recognizes three great divisions of oratory. (See *oratory*.) The art of rhetoric was divided into five parts: invention, disposition, elocution (not in the modern sense, but comprising diction and style), memory (mnemonics), and action (delivery, including the modern elocution).
